ECAM System	**System malfunction or ECAM Alert (Affected System)**	**Reset Procedure**
AUTO FLT	AUTO FLT A/THR OFF	**On ground, before taxi only:** • If no engine running: - Press FCU A/THR pb in order to re-engage the A/THR (this will cancel the ECAM alert) - Press A/THR instinctive disconnect pb to disconnect A/THR. • If at least one engine is running: - Apply external power or APU generator power - ENG MASTER (running engine(s))…………………………...OFF - Press FCU A/THR pb in order to re-engage the A/THR (this will cancel the ECAM alert) - Press A/THR instinctive disconnect pb to disconnect A/THR.
	AUTO FLT FCU 1(2) FAULT (FCU)	**In flight:** - Pull the C/B B05 on 49VU for FCU 1, or M21 on 121VU for FCU 2 - Push it after 5 s - Check the displayed targets and the barometer reference, and correct them if necessary. **On ground:** - Pull the C/B B05 on 49VU for FCU 1, or M21 on 121VU for FCU 2 - Push it after 5 s - If AUTO FLT FCU 1(2) FAULT disappears, check the displayed targets and barometer reference, and correct them if necessary (RESET successful) - If AUTO FLT FCU 1(2) FAULT remains, pull both C/B B05 on 49VU and M21 on 121VU - Push them after 7 min , with a delay of less than 5 s between side 1 and 2 - Wait at least 30 s for FCU 1 and FCU 2 safety tests completion - Check the displayed targets and barometer reference, and correct them if necessary (RESET successful).
	AUTO FLT FCU 1 + 2 FAULT (FCU)	**In flight:** - Pull the C/B B05 on 49VU for FCU 1, and then pull M21 on 121VU for FCU 2 - Push them after 5 s

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		- Check the displayed targets and the barometer reference, and correct them if necessary. **On ground:** - Pull the C/B B05 on 49VU for FCU 1, and then pull M21 on 121VU for FCU 2 - Push the C/Bs after 5 s - If AUTO FLT FCU 1+2 FAULT disappears, check the displayed targets and barometer reference, and correct them if necessary (RESET successful) - If AUTO FLT FCU 1+2 FAULT remains, pull again both C/B B05 on 49VU and M21 on 121VU - Push them after 7 min , with a delay of less than 5 s between side 1 and 2 - Wait at least 30 seconds for FCU 1 and FCU 2 safety tests completion - Check the displayed targets and barometer reference, and correct them if necessary (RESET successful). FCU targets are synchronized on current aircraft values and displayed as selected targets. - Re–enter the barometer altimeter setting value, if necessary.
	AUTO FLT YAW DAMPER 1(2) (FAC 1(2))	**In flight:** If AP is inoperative: - Set FAC 1(2) pb to OFF - Wait 3 s - Set FAC 1(2) pb to ON.
	CAT 3 DUAL displayed in INOP SYS without any other ECAM alert (FAC)	**On ground, or in flight:** Note: *If the CAT 3 DUAL INOP SYS is associated with another ECAM message (in particular ADR FAULT or IR FAULT), it means that the root cause is not an ADR or IR rejection by FAC or FMGC. Consequently, change of AP or FAC reset will not clear the CAT 3 DUAL INOP.* If CAT 3 DUAL is displayed in INOP SYS without any other failure being detected: - Change the AP in command. If unsuccessful: - Set FAC 1 pb to OFF - Wait 3 s - Set FAC 1 pb to ON.

BRAKES	BRAKES SYS 1(2) FAULT
	or
	BRAKES BSCU CH 1(2) FAULT
	(BSCU)
		On ground:
		- STOP aircraft
		- Set PARK BRK handle to ON
		- Confirm that towing bar is disconnected
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON.
		• IF UNSUCCESSFUL:
		  - Pull C/Bs M33 and M34 on 121VU for BSCU channel 1
		  - Pull C/Bs M36 and M35 on 121VU for BSCU channel 2
		  - Push C/Bs.
		After a successful reset, resume to normal operation.
		Note: *After any BSCU reset:*
		1. Check brake efficiency
		2. Record BSCU reset in the logbook.
		In flight:
		When landing gear is up only:
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON
		- If required, rearm the autobrake.
		When landing gear is down: reset not authorized.
		Note: *After any BSCU reset:*
		- Record BSCU reset in the logbook.

DATALINK	ATSU	The ATSU reset should be attempted, only if:
		- INVALID DATA is displayed on the DCDU, or
		- Key selection has no effect on the DCDU or any of the MCDU ATSU DATALINK submenus, or
		- ADS-C, CPDLC, D-ATIS , DCL , OCL or AOC is inoperative.
		On ground or in flight:
		- Pull the C/Bs in the following order: L16, L15 on 121VU
		- Wait 5 s, then
		- Push the C/Bs in the following order: L15, L16.
		When the ATSU is reset, the following connections are no longer active:
		- CPDLC:
		  • The flight crew should send a notification to the ATC center to re-establish the CPDLC connection.
		- ADS-C:
		  • The flight crew must check that ADS-C is ARMED or ON.
		  • The flight crew should contact the ATC center by voice to re-establish the ADS-C connection.
		  Note: As no ADS-C disconnect message is sent, the ATC center(s) consider that the ADS-C connection is still alive.

	CINS	If there is a malfunction of the CINS and if the reset by the cabin crew is unsuccessful, the flight crew can attempt to reset the system using the CINS RESET pb on the panel 45VU on the overhead panel. *Note: The CINS reset may take up to 10 min.*
	DATALINK ATC FAULT or DATALINK COMPANY FAULT or COM VHF 3 DATA FAULT (VHF3)	**On ground or in flight:** - Pull the COM / VHF3 C/B L05 on 121VU - Wait 5 s - Push the COM / VHF3 C/B L05 on 121VU.

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		Wait for AUTO FLT FAC 1 FAULT to disappear, and: - Set FAC 2 pb to OFF - Wait 3 s - Set FAC 2 pb to ON.
	One MCDU locked or blank (MCDU)	**On ground, or in flight:** - Pull the C/B for the locked or blank MCDU and push it back after 10 s. The circuit breakers for the MCDUs are: - AUTO FLT/MCDU 1 B1 ON 49 VU (Overhead Panel) - AUTO FLT/MCDU 2 N20 ON 121 VU (Right Rear Maintenance Panel) - AUTO FLT/MCDU 3 N21 ON 121 VU (Right Rear Maintenance Panel).

	Both MCDU locked or blank or FMGC malfunction (FMGC)	The circuit breakers for the FMGCs are:
		- AUTO FLT/FMGC 1 B2 ON 49 VU (Overhead Panel)
		- AUTO FLT/FMGC 2 M17 ON 121 VU (Right Rear Maintenance Panel).
		On ground:
		- If no engine running:
		  - Apply external power or APU generator power
		  - Wait 2 min before resetting the FMGC circuit breakers
		  - Set FD 1(2) pb to OFF
		  - Pull the C/B of the affected FMGC
		  - Wait 10 s
		  - Push the C/B of the affected FMGC.
		CAUTION Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.
		- If engines running:
		  - Set FD 1(2) pb to OFF.
		  - Pull the C/B of the affected FMGC.
		  - Wait 10 s.
		  - Push the C/B of the affected FMGC.
		CAUTION Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.
		- If FMGC reset is unsuccessful:
		  - Consider FMGC reset with engines not running.

Continued on the following page

Continued from the previous page

ECAM System	**System malfunction or ECAM Alert (Affected System)**	**Reset Procedure**
		Note: *The FMGC reset is more effective with engines not running.* **In flight:** - Set non-affected AP 2(1) pb to ON - Set FD 1(2) pb to OFF - Pull the C/B of the affected FMGC - Wait 10 s - Push the C/B of the affected FMGC. **CAUTION** Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.

BRAKES	BRAKES SYS 1(2) FAULT
	or
	BRAKES BSCU CH 1(2) FAULT
	(BSCU)
		On ground:
		- STOP aircraft
		- Set PARK BRK handle to ON
		- Confirm that towing bar is disconnected
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON.
		• IF UNSUCCESSFUL:
		  - Pull C/Bs M33 and M34 on 121VU for BSCU channel 1
		  - Pull C/Bs M36 and M35 on 121VU for BSCU channel 2
		  - Push C/Bs.
		After a successful reset, resume to normal operation.
		Note: *After any BSCU reset:*
		1. Check brake efficiency
		2. Record BSCU reset in the logbook.
		In flight:
		When landing gear is up only:
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON
		- If required, rearm the autobrake.
		When landing gear is down: reset not authorized.
		Note: *After any BSCU reset:*
		- Record BSCU reset in the logbook.

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
120 AUTO FLT	AUTO FLT A/THR OFF	**On ground, before taxi only:** • If no engine running: - Press FCU A/THR pb in order to re-engage the A/THR (this will cancel the ECAM alert) - Press A/THR instinctive disconnect pb to disconnect A/THR. • If at least one engine is running: - Apply external power or APU generator power - ENG MASTER (running engine(s))…………………………...OFF - Press FCU A/THR pb in order to re-engage the A/THR (this will cancel the ECAM alert) - Press A/THR instinctive disconnect pb to disconnect A/THR.
	AUTO FLT FCU 1(2) FAULT (FCU)	**In flight:** - Pull the C/B B05 on 49VU for FCU 1, or M21 on 121VU for FCU 2 - Push it after 5 s - Check the displayed targets and the barometer reference, and correct them if necessary. **On ground:** - Pull the C/B B05 on 49VU for FCU 1, or M21 on 121VU for FCU 2 - Push it after 5 s - If AUTO FLT FCU 1(2) FAULT disappears, check the displayed targets and barometer reference, and correct them if necessary (RESET successful) - If AUTO FLT FCU 1(2) FAULT remains, pull both C/B B05 on 49VU and M21 on 121VU - Push them after 7 min , with a delay of less than 5 s between side 1 and 2 - Wait at least 30 s for FCU 1 and FCU 2 safety tests completion - Check the displayed targets and barometer reference, and correct them if necessary (RESET successful).
	AUTO FLT FCU 1 + 2 FAULT (FCU)	**In flight:** - Pull the C/B B05 on 49VU for FCU 1, and then pull M21 on 121VU for FCU 2 - Push them after 5 s

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		- Check the displayed targets and the barometer reference, and correct them if necessary. **On ground:** - Pull the C/B B05 on 49VU for FCU 1, and then pull M21 on 121VU for FCU 2 - Push the C/Bs after 5 s - If AUTO FLT FCU 1+2 FAULT disappears, check the displayed targets and barometer reference, and correct them if necessary (RESET successful) - If AUTO FLT FCU 1+2 FAULT remains, pull again both C/B B05 on 49VU and M21 on 121VU - Push them after 7 min , with a delay of less than 5 s between side 1 and 2 - Wait at least 30 seconds for FCU 1 and FCU 2 safety tests completion - Check the displayed targets and barometer reference, and correct them if necessary (RESET successful). FCU targets are synchronized on current aircraft values and displayed as selected targets. - Re–enter the barometer altimeter setting value, if necessary.
	AUTO FLT YAW DAMPER 1(2) (FAC 1(2))	**In flight:** If AP is inoperative: - Set FAC 1(2) pb to OFF - Wait 3 s - Set FAC 1(2) pb to ON.
	CAT 3 DUAL displayed in INOP SYS without any other ECAM alert (FAC)	**On ground, or in flight:** *Note: If the CAT 3 DUAL INOP SYS is associated with another ECAM message (in particular ADR FAULT or IR FAULT), it means that the root cause is not an ADR or IR rejection by FAC or FMGC. Consequently, change of AP or FAC reset will not clear the CAT 3 DUAL INOP.* If CAT 3 DUAL is displayed in INOP SYS without any other failure being detected: - Change the AP in command. If unsuccessful: - Set FAC 1 pb to OFF - Wait 3 s - Set FAC 1 pb to ON.

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		Wait for AUTO FLT FAC 1 FAULT to disappear, and: - Set FAC 2 pb to OFF - Wait 3 s - Set FAC 2 pb to ON.
	One MCDU locked or blank (MCDU)	**On ground, or in flight:** - Pull the C/B for the locked or blank MCDU and push it back after 10 s. The circuit breakers for the MCDUs are: • AUTO FLT/MCDU 1 B1 ON 49 VU (Overhead Panel) • AUTO FLT/MCDU 2 N20 ON 121 VU (Right Rear Maintenance Panel) • AUTO FLT/MCDU 3 N21 ON 121 VU (Right Rear Maintenance Panel).
	Both MCDU locked or blank or FMGC malfunction (FMGC)	The circuit breakers for the FMGCs are: • AUTO FLT/FMGC 1 B2 ON 49 VU (Overhead Panel) • AUTO FLT/FMGC 2 M17 ON 121 VU (Right Rear Maintenance Panel). **On ground:** • If no engine running: - Apply external power or APU generator power - Wait 2 min before resetting the FMGC circuit breakers - Set FD 1(2) pb to OFF - Pull the C/B of the affected FMGC - Wait 10 s - Push the C/B of the affected FMGC. **CAUTION** Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC. • If engines running: - Set FD 1(2) pb to OFF. - Pull the C/B of the affected FMGC. - Wait 10 s. - Push the C/B of the affected FMGC. **CAUTION** Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC. • If FMGC reset is unsuccessful: - Consider FMGC reset with engines not running.

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		Note: The FMGC reset is more effective with engines not running. **In flight:** - Set non-affected AP 2(1) pb to ON - Set FD 1(2) pb to OFF - Pull the C/B of the affected FMGC - Wait 10 s - Push the C/B of the affected FMGC. **CAUTION** Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.

BRAKES	BRAKES SYS 1(2) FAULT
	or
	BRAKES BSCU CH 1(2) FAULT
	(BSCU)
		On ground:
		- STOP aircraft
		- Set PARK BRK handle to ON
		- Confirm that towing bar is disconnected
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON.
		• IF UNSUCCESSFUL:
		  - Pull C/Bs M33 and M34 on 121VU for BSCU channel 1
		  - Pull C/Bs M36 and M35 on 121VU for BSCU channel 2
		  - Push C/Bs.
		After a successful reset, resume to normal operation.
		Note: After any BSCU reset:
		1. Check brake efficiency
		2. Record BSCU reset in the logbook.
		In flight:
		When landing gear is up only:
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON
		- If required, rearm the autobrake.
		When landing gear is down: reset not authorized.
		Note: After any BSCU reset:
		- Record BSCU reset in the logbook.

ECAM System	**System malfunction or ECAM Alert (Affected System)**	**Reset Procedure**
AIR	AIR PACK 1(2) REGUL FAULT (ACSC)	**On ground only:** - Pull C/Bs W21 and W22 on 122VU - Pull C/Bs X21 and X22 on 122VU - Pull C/Bs Y18, Y20 and Y21 on 122VU - Pull C/B D8 on 49VU - Wait 5 s before pushing all the C/Bs. *Note: During the reset, a small increase of the engine thrust may be observed (N1 or EPR, as applicable). If the parking brake is set, vibrations can occur.*
	AIR ENG 1(2) ABNORM PR and AIR PACK 2(1) REGUL FAULT (EIU)	**On ground only:** If PACK 2(1) is set to ON: PACK 2(1)...............................OFF PACK 2(1)...............................ON *Note: This will clear the AIR PACK 2(1) REGUL FAULT ECAM alert.*
	AIR ENG 1(2) BLEED FAULT or AIR ENG 1(2) BLEED ABNORM PR (Engine Bleed Supply System)	**CAUTION** If the BLEED NOT CLOSED subtitle is displayed in the AIR ENG 1(2) BLEED FAULT alert, do not reset the affected ENG BLEED. *Note: Do not attempt more than one reset. However, if the first reset is unsuccessful and if the AIR ENG 1(2) BLEED FAULT alert occurred after takeoff with APU bleed ON, a second reset may be attempted when flight conditions permit and when the aircraft is stabilized in level flight.* **On ground or in flight** • **If the PACK (non-affected side) is operative, and If the Wing Anti-Ice is OFF:** - ENG BLEED (affected side)...............................OFF ■ **If the ENG BLEED (affected side) pb-sw FAULT light is on:** - Delay application of the reset until FAULT light extinguishes. ■ **If the ENG BLEED (affected side) pb-sw FAULT light is off:** - X BLEED...AUTO

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		- PACK (affected side)..................................ON - ENG BLEED (affected side)........................ON - Check that the affected Engine Bleed Valve is open on the BLEED SD page. • **If** AIR ENG (AFFECTED) BLEED FAULT **alert or** AIR ENG (AFFECTED) BLEED ABNORM PR **alert reoccurs, or** **If Engine Bleed Valve (affected side) not open on the** BLEED SD page**:** - ENG BLEED (affected side)...............OFF - PACK (affected side)..........................OFF - X BLEED.......................................OPEN *Note:* *Record the ENG BLEED reset in the logbook (successful or unsuccessful).*
	AIR ENG 1(2) BLEED NOT CLSD (Engine Bleed Supply System)	*Note:* *Do not attempt more than one reset.* **On ground only** - ENG BLEED (affected side)..............................OFF ■ **If the ENG BLEED (affected side) pb-sw FAULT light is on:** - Delay application of the reset until FAULT light extinguishes. ■ **If the ENG BLEED (affected side) pb-sw FAULT light is off:** - ENG BLEED (affected side).......................ON - Check that the affected Engine Bleed Valve is closed on the BLEED SD page. *Note:* *Record the ENG BLEED reset in the logbook (successful or unsuccessful).*

133

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
AUTO FLT	AUTO FLT A/THR OFF	**On ground, before taxi only:** • If no engine running: - Press FCU A/THR pb in order to re-engage the A/THR (this will cancel the ECAM alert) - Press A/THR instinctive disconnect pb to disconnect A/THR. • If at least one engine is running: - Apply external power or APU generator power - ENG MASTER (running engine(s))…………………………...OFF - Press FCU A/THR pb in order to re-engage the A/THR (this will cancel the ECAM alert) - Press A/THR instinctive disconnect pb to disconnect A/THR.
	AUTO FLT FCU 1(2) FAULT (FCU)	**In flight:** - Pull the C/B B05 on 49VU for FCU 1, or M21 on 121VU for FCU 2 - Push it after 5 s - Check the displayed targets and the barometer reference, and correct them if necessary. **On ground:** - Pull the C/B B05 on 49VU for FCU 1, or M21 on 121VU for FCU 2 - Push it after 5 s - If AUTO FLT FCU 1(2) FAULT disappears, check the displayed targets and barometer reference, and correct them if necessary (RESET successful) - If AUTO FLT FCU 1(2) FAULT remains, pull both C/B B05 on 49VU and M21 on 121VU - Push them after 7 min , with a delay of less than 5 s between side 1 and 2 - Wait at least 30 s for FCU 1 and FCU 2 safety tests completion - Check the displayed targets and barometer reference, and correct them if necessary (RESET successful).
	AUTO FLT FCU 1 + 2 FAULT (FCU)	**In flight:** - Pull the C/B B05 on 49VU for FCU 1, and then pull M21 on 121VU for FCU 2 - Push them after 5 s

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		- Check the displayed targets and the barometer reference, and correct them if necessary. **On ground:** - Pull the C/B B05 on 49VU for FCU 1, and then pull M21 on 121VU for FCU 2 - Push the C/Bs after 5 s - If AUTO FLT FCU 1+2 FAULT disappears, check the displayed targets and barometer reference, and correct them if necessary (RESET successful) - If AUTO FLT FCU 1+2 FAULT remains, pull again both C/B B05 on 49VU and M21 on 121VU - Push them after 7 min , with a delay of less than 5 s between side 1 and 2 - Wait at least 30 seconds for FCU 1 and FCU 2 safety tests completion - Check the displayed targets and barometer reference, and correct them if necessary (RESET successful). FCU targets are synchronized on current aircraft values and displayed as selected targets. - Re–enter the barometer altimeter setting value, if necessary.
	AUTO FLT YAW DAMPER 1(2) (FAC 1(2))	**In flight:** If AP is inoperative: - Set FAC 1(2) pb to OFF - Wait 3 s - Set FAC 1(2) pb to ON.
	CAT 3 DUAL displayed in INOP SYS without any other ECAM alert (FAC)	**On ground, or in flight:** *Note: If the CAT 3 DUAL INOP SYS is associated with another ECAM message (in particular ADR FAULT or IR FAULT), it means that the root cause is not an ADR or IR rejection by FAC or FMGC. Consequently, change of AP or FAC reset will not clear the CAT 3 DUAL INOP.* If CAT 3 DUAL is displayed in INOP SYS without any other failure being detected: - Change the AP in command. If unsuccessful: - Set FAC 1 pb to OFF - Wait 3 s - Set FAC 1 pb to ON.

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		Wait for AUTO FLT FAC 1 FAULT to disappear, and: - Set FAC 2 pb to OFF - Wait 3 s - Set FAC 2 pb to ON.
	One MCDU locked or blank (MCDU)	**On ground, or in flight:** - Pull the C/B for the locked or blank MCDU and push it back after 10 s. The circuit breakers for the MCDUs are: - AUTO FLT/MCDU 1 B1 ON 49 VU (Overhead Panel) - AUTO FLT/MCDU 2 N20 ON 121 VU (Right Rear Maintenance Panel) - AUTO FLT/MCDU 3 N21 ON 121 VU (Right Rear Maintenance Panel).

	Both MCDU locked or blank or FMGC malfunction
	(FMGC)
		The circuit breakers for the FMGCs are:
		- AUTO FLT/FMGC 1 B2 ON 49 VU (Overhead Panel)
		- AUTO FLT/FMGC 2 M17 ON 121 VU (Right Rear Maintenance Panel).
		On ground:
		- If no engine running:
		  - Apply external power or APU generator power
		  - Wait 2 min before resetting the FMGC circuit breakers
		  - Set FD 1(2) pb to OFF
		  - Pull the C/B of the affected FMGC
		  - Wait 10 s
		  - Push the C/B of the affected FMGC.
		CAUTION Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.
		- If engines running:
		  - Set FD 1(2) pb to OFF.
		  - Pull the C/B of the affected FMGC.
		  - Wait 10 s.
		  - Push the C/B of the affected FMGC.
		CAUTION Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.
		- If FMGC reset is unsuccessful:
		  - Consider FMGC reset with engines not running.

Continued on the following page

Continued from the previous page

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
		Note: *The FMGC reset is more effective with engines not running.* **In flight:** - Set non-affected AP 2(1) pb to ON - Set FD 1(2) pb to OFF - Pull the C/B of the affected FMGC - Wait 10 s - Push the C/B of the affected FMGC. **CAUTION** Always wait 1 min after the PLEASE WAIT message disappears from the MCDU, before engaging or reengaging the FDs and the AP of the reset FMGC.

BRAKES	BRAKES SYS 1(2) FAULT
	or
	BRAKES BSCU CH 1(2) FAULT
	(BSCU)
		On ground:
		- STOP aircraft
		- Set PARK BRK handle to ON
		- Confirm that towing bar is disconnected
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON.
		• IF UNSUCCESSFUL:
		  - Pull C/Bs M33 and M34 on 121VU for BSCU channel 1
		  - Pull C/Bs M36 and M35 on 121VU for BSCU channel 2
		  - Push C/Bs.
		After a successful reset, resume to normal operation.
		Note: *After any BSCU reset:*
		1. Check brake efficiency
		2. Record BSCU reset in the logbook.
		In flight:
		When landing gear is up only:
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON
		- If required, rearm the autobrake.
		When landing gear is down: reset not authorized.
		Note: *After any BSCU reset:*
		- Record BSCU reset in the logbook.

VENT	VENT AVNCS SYS FAULT (AEVC)	**On ground only:** - Pull C/B Y17 on 122VU - Wait 30 s before pushing the C/B.

Ident.: PRO-ABN-ABN-RESET-B-00021058.0001001 / 17 MAY 21

WHEEL	WHEEL N.W STEER FAULT or WHEEL N/W STRG FAULT (BSCU)	**On ground only:** **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULT alert was triggered just after engine start - the N/W STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the N/W STRG DISC memo remained displayed even after the pushback is finished (nosewheel steering selector bypass pin is in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. **Case B** In all other cases, including in case of doubt on the above conditions, troubleshooting must be performed before continuing the flight, even if the ECAM alert disappears after the reset. For a return to the gate : - Apply the below reset procedure - The taxi speed must not exceed 10 kt. **Reset Procedure:** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. *Note:* *After any BSCU reset:* *1. Check brake efficiency* *2. Check absence of aircraft veering* *3. Record the BSCU reset in the logbook.*

BRAKES	BRAKES SYS 1(2) FAULT
	or
	BRAKES BSCU CH 1(2) FAULT
	(BSCU)
		On ground:
		- STOP aircraft
		- Set PARK BRK handle to ON
		- Confirm that towing bar is disconnected
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON.
		• IF UNSUCCESSFUL:
		  - Pull C/Bs M33 and M34 on 121VU for BSCU channel 1
		  - Pull C/Bs M36 and M35 on 121VU for BSCU channel 2
		  - Push C/Bs.
		After a successful reset, resume to normal operation.
		Note: After any BSCU reset:
		1. Check brake efficiency
		2. Record BSCU reset in the logbook.
		In flight:
		When landing gear is up only:
		- Set A/SKID & N/W STRG sw to OFF
		- Set A/SKID & N/W STRG sw to ON
		- If required, rearm the autobrake.
		When landing gear is down: reset not authorized.
		Note: After any BSCU reset:
		- Record BSCU reset in the logbook.

VENT	VENT AVNCS SYS FAULT (AEVC)	**On ground only:** - Pull C/B Y17 on 122VU - Wait 30 s before pushing the C/B.
Ident.: PRO-ABN-ABN-RESET-B-00021058.0001001 / 17 MAY 21		
WHEEL	WHEEL N.W STEER FAULT or WHEEL N/W STRG FAULT (BSCU)	**On ground only:** **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULT alert was triggered just after engine start - the N/W STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the N/W STRG DISC memo remained displayed even after the pushback is finished (nosewheel steering selector bypass pin is in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. **Case B** In all other cases, including in case of doubt on the above conditions, troubleshooting must be performed before continuing the flight, even if the ECAM alert disappears after the reset. For a return to the gate : - Apply the below reset procedure - The taxi speed must not exceed 10 kt. **Reset Procedure:** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. *Note:* *After any BSCU reset:* *1. Check brake efficiency* *2. Check absence of aircraft veering* *3. Record the BSCU reset in the logbook.*

VENT	VENT AVNCS SYS FAULT (AEVC)	**On ground only:** - Pull C/B Y17 on 122VU - Wait 30 s before pushing the C/B.

Ident.: PRO-ABN-ABN-RESET-B-00021058.0001001 / 17 MAY 21

WHEEL	WHEEL N.W STEER FAULT or WHEEL N/W STRG FAULT (BSCU)	**On ground only:** **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULT alert was triggered just after engine start - the N/W STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the N/W STRG DISC memo remained displayed even after the pushback is finished (nosewheel steering selector bypass pin is in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. **Case B** In all other cases, including in case of doubt on the above conditions, troubleshooting must be performed before continuing the flight, even if the ECAM alert disappears after the reset. For a return to the gate : - Apply the below reset procedure - The taxi speed must not exceed 10 kt. **Reset Procedure:** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. *Note: After any BSCU reset:* *1. Check brake efficiency* *2. Check absence of aircraft veering* *3. Record the BSCU reset in the logbook.*

ECAM System	**System malfunction or ECAM Alert (Affected System)**	**Reset Procedure**
NAV	NAV GPWS FAULT and NAV GPWS TERR DET FAULT (EGPWS)	**On ground, or in flight:** Perform the following reset when both alerts are displayed at the same time. - Pull C/B P07 on 121VU, - Set GPWS SYS pb and GPWS TERR pb to ON, - Wait 5 s, then push the C/B.
	NAV GPWS FAULT or NAV GPWS TERR DET FAULT (EGPWS)	**On ground only:** - Pull C/B P07 on 121VU, - Set GPWS SYS pb and GPWS TERR pb to ON, - Wait 5 s, then push the C/B.
	NAV TCAS FAULT (TCAS)	**On ground only:** - Pull C/B K10 on 121VU. - Wait 5 s, then push the C/B.
	ISIS malfunction (ISIS)	**On ground only:** With aircraft not moving: - Pull C/B F12 on 49VU, - Wait 5 s, then push the C/B, - Normal operation is expected after approximately 2 min. *Note:* *In the case of small aircraft motion during the C/B reset (refueling, cargo loading conditions, etc.), the ATT red flag may appear on the ISIS. In this case, press the RST P/B for 2 s and wait 2 min additional to recover normal operation.*

VENT	VENT AVNCS SYS FAULT (AEVC)	**On ground only:** - Pull C/B Y17 on 122VU - Wait 30 s before pushing the C/B.

Ident.: PRO-ABN-ABN-RESET-B-00021058.0001001 / 17 MAY 21

WHEEL	WHEEL N.W STEER FAULT or WHEEL N/W STRG FAULT (BSCU)	**On ground only:** **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULT alert was triggered just after engine start - the N/W STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the N/W STRG DISC memo remained displayed even after the pushback is finished (nosewheel steering selector bypass pin is in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. **Case B** In all other cases, including in case of doubt on the above conditions, troubleshooting must be performed before continuing the flight, even if the ECAM alert disappears after the reset. For a return to the gate : - Apply the below reset procedure - The taxi speed must not exceed 10 kt. **Reset Procedure:** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. *Note:* *After any BSCU reset:* *1. Check brake efficiency* *2. Check absence of aircraft veering* *3. Record the BSCU reset in the logbook.*

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
NAV	NAV GPWS FAULT and NAV GPWS TERR DET FAULT (EGPWS)	**On ground, or in flight:** Perform the following reset when both alerts are displayed at the same time. - Pull C/B P07 on 121VU, - Set GPWS SYS pb and GPWS TERR pb to ON, - Wait 5 s, then push the C/B.
	NAV GPWS FAULT or NAV GPWS TERR DET FAULT (EGPWS)	**On ground only:** - Pull C/B P07 on 121VU, - Set GPWS SYS pb and GPWS TERR pb to ON, - Wait 5 s, then push the C/B.
	NAV TCAS FAULT (TCAS)	**On ground only:** - Pull C/B K10 on 121VU. - Wait 5 s, then push the C/B.
	ISIS malfunction (ISIS)	**On ground only:** With aircraft not moving: - Pull C/B F12 on 49VU, - Wait 5 s, then push the C/B, - Normal operation is expected after approximately 2 min. *Note:* *In the case of small aircraft motion during the C/B reset (refueling, cargo loading conditions, etc.), the ATT red flag may appear on the ISIS. In this case, press the RST P/B for 2 s and wait 2 min additional to recover normal operation.*

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
VENT	VENT AVNCS SYS FAULT (AEVC)	**On ground only:** - Pull C/B Y17 on 122VU - Wait 30 s before pushing the C/B.

Ident.: PRO-ABN-ABN-RESET-B-00021058.0001001 / 17 MAY 21

ECAM System	System malfunction or ECAM Alert (Affected System)	Reset Procedure
WHEEL	WHEEL N.W STEER FAULT or WHEEL N/W STRG FAULT (BSCU)	**On ground only:** **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULT alert was triggered just after engine start - the N/W STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the N/W STRG DISC memo remained displayed even after the pushback is finished (nosewheel steering selector bypass pin is in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. **Case B** In all other cases, including in case of doubt on the above conditions, troubleshooting must be performed before continuing the flight, even if the ECAM alert disappears after the reset. For a return to the gate : - Apply the below reset procedure - The taxi speed must not exceed 10 kt. **Reset Procedure:** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. *Note:* *After any BSCU reset:* *1. Check brake efficiency* *2. Check absence of aircraft veering* *3. Record the BSCU reset in the logbook.*

WHEEL	WHEEL N.W STEER FAULT or WHEEL N/W STRG FAULT (BSCU)	**On ground only:** **Case A** If the three conditions below are fulfilled: - the WHEEL N/W STRG FAULT alert was triggered just after engine start - the N/W STRG DISC memo was displayed before the start of the pushback (before the aircraft starts moving) - the N/W STRG DISC memo remained displayed even after the pushback is finished (nosewheel steering selector bypass pin is in the steering position). Apply the below reset procedure. If the ECAM alert disappears after the reset, the flight crew may continue the flight without troubleshooting. **Case B** In all other cases, including in case of doubt on the above conditions, troubleshooting must be performed before continuing the flight, even if the ECAM alert disappears after the reset. For a return to the gate : - Apply the below reset procedure - The taxi speed must not exceed 10 kt. **Reset Procedure:** - STOP aircraft - Set PARK BRK handle to ON - Confirm that towing bar is disconnected - Set A/SKID & N/W STRG sw to OFF - Set A/SKID & N/W STRG sw to ON. *Note:* *After any BSCU reset:* *1. Check brake efficiency* *2. Check absence of aircraft veering* *3. Record the BSCU reset in the logbook.*

Intentionally left blank

[QRH] DOUBLE AOA HEAT FAILURE

Ident.: PRO-ABN-A-ICE-00010253.0002001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-08596, 09190-09324

In the case of double failure of alpha probe heaters, the choice made by the computers among the 3 ADR values may be erroneous.

One of affected ADRs..........OFF

Keep preferably ADR1 available as ADR1 is supplied in EMER ELEC config.

NAV ADR 1(2)(3) FAULT
In the case of disagreement between the two remaining ADRs, the NAV ADR DISAGREE ECAM alert will trigger.

ANTI ICE ALL PITOT

11

L2 In the case of simultaneous pitot icing and in the same amount, ADR 1 and ADR 3 speeds will be in agreement, but incorrect. Flight controls will consider the remaining correct source as being faulty, and will reject the only correct source. The following ECAM procedure avoids that the flight controls use two erroneous, but coherent, sources.

L1 ■ **If ADR 2 operative and ON:**

ADR 1(3) P/B..OFF

L2 *Depending on the status of the static, AOA, and TAT heating, the ECAM requires that either ADR 1 or 3 be switched OFF*

Note: In the case of subsequent, significant, speed discrepancy between the two remaining ADRs, the "ADR DISAGREE" ECAM caution will trigger.

L1 ■ **If ADR 2 failed or OFF:**

L2 No action is required, as long as there are no icing conditions, in order to keep two independent speed sources.

L1 ● **IF ICING EXPECTED:**

ADR 1(3) P/B..OFF

L2 *Depending on the status of the static, AOA, and TAT heating, the ECAM requires that either ADR 1 or 3 be switched OFF.*

L1 UNREL SPD PROC..APPLY

L2 *Only one ADR is available, and the corresponding pitot probe may be affected by ice accretion. Be prepared to use the UNRELIABLE SPEED INDICATION procedure (Refer to procedure).*

ANNUNCIATIONS

Triggering Conditions:

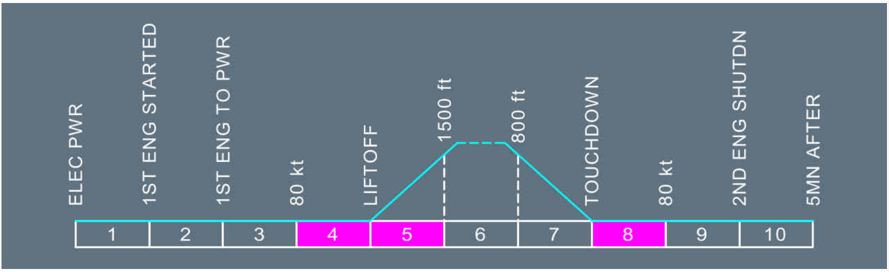
L2 This alert triggers when the heating systems of the F/O and STBY AOA probes are failed.

Flight Phase Inhibition:



Ident.: PRO-ABN-A-ICE-AC-00022259.0001001 / 30 MAR 18

32

L2 In the case of simultaneous AOA probes icing and if the AOA probes are blocked in the same angular position, AOA values from ADR 2 and ADR 3 will be in agreement but incorrect. Therefore, flight controls will consider the remaining correct ADR 1 source as being faulty, and will reject the only correct source. The following ECAM procedure avoids that the flight controls use two erroneous but coherent AOA sources.

L1 ADR 2(3) P/B.. OFF

L2 *Depending on the status of the static, pitot and TAT heating, the ECAM requires that either ADR 2 or 3 be switched OFF.*

Note: In the case of subsequent and significant AOA discrepancy between the two remaining ADRs, the "NAV ADR DISAGREE" ECAM caution will trigger.

L2 In the case of simultaneous pitot icing and in the same amount, ADR 2 and ADR 3 speeds will be in agreement, but incorrect. Therefore, flight controls will consider the remaining correct source as being faulty, and will reject the only correct source. The following ECAM procedure avoids that the flight controls use two erroneous, but coherent, sources.

L1 ■ **If ADR 1 operative and ON:**

ADR 2(3) P/B..OFF

L2 *Depending on the status of the static, AOA, and TAT heating, the ECAM requires that either ADR 2 or 3 be switched OFF.*

Note: In the case of subsequent, significant, speed discrepancy between the two remaining ADRs, the “ADR DISAGREE” ECAM caution will trigger.

L1 ■ **If ADR 1 failed or OFF:**

L2 No action is required, as long as there are no icing conditions, in order to keep two independent speed sources.

L1 ● **IF ICING EXPECTED:**

ADR 2(3) P/B..OFF

L2 *Depending on the status of the static, AOA, and TAT heating, the ECAM requires that either ADR 2 or 3 be switched OFF.*

L1 UNREL SPD PROC..APPLY

L2 *Only one ADR is available, and the corresponding pitot probe may be affected by ice accretion. Be prepared to use the UNRELIABLE SPEED INDICATION procedure (Refer to procedure).*

7

PFD BARO REF: STD ONLY

L2 *With both FCU channels failed, the barometer reference automatically goes to 1 013 hPa.*
Use standby altimeter, and change this to the actual barometer setting.
Do not insert the MDA (MDH) value on the MCDU PERF APPR Page (because the PFD altitude is referenced to STD, and not to the correct barometric value).
The PM must then perform the standard callouts ("HUNDRED ABOVE"and "MINIMUM"), using the STBY altimeter.

In addition:

- *All FCU controls are inoperative.*
- *A/THR, AP 1 + 2, and FD 1 + 2 are not available.*
  (Except in LAND or GO AROUND mode where only A/THR is lost).
- *On PFD:*
  - *Altitude alert is inoperative.*
  - *ILS/GLS ◁ /MLS ◁ deviation scales are displayed.*
  - *Flight path vector is displayed.*
  - *Mach indication is inoperative.*
  - *FMA is lost except in LAND or GA mode.*
- *On ND:*
  - *ROSE NAV mode with map (80 NM range) is displayed.*
  - *VOR/ADF needles:*
    Needle 1 is related to VOR1 only.
    Needle 2 is related to ADF2 only (ADF1 if ADF2 not installed).
    (VOR selection on DDRMI ◁ is not affected)
    (ADF selection on DDRMI ◁ (if available) is not affected).
  - *The weather radar image may be lost. If the image remains displayed it must be disregarded. In all cases, red "WXR RNG" message is displayed.*

[MEM] LOSS OF BRAKING

Ident.: PRO-ABN-BRAKES-00011315.0002001 / 05 JUN 18

1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

- **If no braking:**

  REV....................MAX

  L2 *If needed, the flight crew may keep maximum reverse thrust until full aircraft stop.*

  L1 BRAKE PEDALS....................RELEASE

  L2 *When the flight crew sets the A/SKID & N/W STRG sw to OFF, the control of the braking system is transferred from the BSCU to the ABCU, and the alternate braking mode is activated. Consequently the PF should release the brake pedals before the PM selects the A/SKID off.*
  This action avoids brutal braking application.
  For information on the alternate braking mode, Refer to DSC-32-30-10 Braking Modes - Alternate Braking without Anti-Skid.

  L1 A/SKID OFF....................ORDER

  L2 *The PF orders the PM to set the A/SKID & N/W STRG sw to OFF.*

  L1 A/SKID & N/W STRG....................OFF
  BRAKE PEDALS....................PRESS
  MAX BRK PR....................1000 PSI

  L2 *The ABCU automatically limits the brake pressure to 1 000 PSI. Monitor brake pressure on the BRAKES PRESS indicator.*

  L1
  - **If still no braking:**

    PARK BRAKE....................USE

    Use short successive parking brake applications to stop the aircraft.
    L2 *For more information on the parking brake, Refer to DSC-32-30-10 Braking Modes - Parking Brake.*

[MEM] LOSS OF BRAKING

- **If no braking:**

REV..MAX

L2 *If needed, the flight crew may keep maximum reverse thrust until full aircraft stop.*

L1 BRAKE PEDALS..RELEASE

L2 *When the flight crew sets the A/SKID & N/W STRG sw to OFF, the alternate braking mode is activated. Consequently the PF should release the brake pedals before the PM selects the A/SKID off. This action avoids brutal braking application.*
For information on the alternate braking mode, Refer to DSC-32-30-10 Braking Modes - Alternate Braking without Anti-Skid.

L1 A/SKID OFF..ORDER

L2 *The PF orders the PM to set the A/SKID & N/W STRG sw to OFF.*

L1 A/SKID & N/W STRG..OFF
BRAKE PEDALS..PRESS
MAX BRK PR..1000 PSI

L2 *Limit brake pressure to approximately 1 000 PSI. Monitor brake pressure on the BRAKES PRESS indicator.*

L1
  - **If still no braking:**

    PARK BRAKE..USE

    Use short successive parking brake applications to stop the aircraft.

L2 *For more information on the parking brake, Refer to DSC-32-30-10 Braking Modes - Parking Brake.*

[QRH] ASYMMETRIC BRAKING

Ident.: PRO-ABN-BRAKES-00011331.0001001 / 17 MAR 17
2 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

Apply this procedure when all brakes of one gear are released.

AVOID XWIND > 10 KT FROM SIDE OF AVAILABLE BRAKE
APPLY BRAKE PROGRESSIVELY ON AVAILABLE SIDE
USE RUDDER TO COUNTER LATERAL DEVIATION

- **If reverser inoperative on same side as inoperative brakes:** DO NOT USE REVERSERS

LDG DIST PROC..........APPLY

[QRH] RESIDUAL BRAKING

Ident.: PRO-ABN-BRAKES-00011318.0001001 / 17 MAR 17
Applicable to: ALL

- **In flight:**
  BRAKE PEDALS..........PRESS SEVERAL TIMES
  Press the brake pedals several times. This could zero a residual pressure on the alternate system.
  - **If residual pressure remains:**
    A/SKID & N/W STRG sel..........KEEP ON
    - **For landing:**
      AUTO/BRK..........MED
      Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.
      - **If autobrake not available:**
        APPLY BRAKING JUST AFTER TOUCHDOWN

    POSSIBLE BRAKING ASYMMETRY

  Note: *If tire damage is suspected after landing, Refer to LIM-LG Taxi with Deflated or Damaged Tires.*

COM VHF 1(2)(3) /HF 1(2) EMITTING ◁

Applicable to: ALL

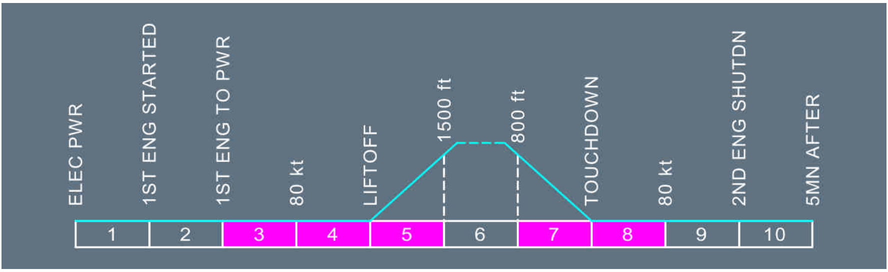
Ident.: PRO-ABN-COM-I-00016892.0001001 / 21 MAR 16

ANNUNCIATIONS

Triggering Conditions:

L2 For VHF 1(2)(3) EMITTING, the alert triggers when the transmitter emits more than 30 s or 60 s depending on aircraft configuration.
For HF 1(2) EMITTING, the alert triggers when the transmitter emits more than 60 s.

Flight Phase Inhibition:



Ident.: PRO-ABN-COM-I-00017549.0001001 / 21 MAR 16

L2 1. If any Push To Talk (PTT) transmission selector (sidestick PTT ◁ , hand mike PTT ◁ , or ACP PTT switch ◁) is jammed in the transmit position, try to release it in order to remove the caution.
2. If unsuccessful, deselect the identified failed VHF/HF transmission keys on the associated Audio Control Panel (ACP) to remove the caution. This ACP should only be used in reception mode. The associated PTT transmission selectors must not be used.

   Note: *In this case, the ACP of the unaffected side may be used to recover the deselected VHF/HF channel.*

3. If no transmission key on the ACP is found in the “transmit” position, pull the affected VHF/HF C/B associated to the ECAM message : COM\HF1 C/B HA 14 on 49 VU, COM NAV\HF2 C/B L13 on 121 VU, COM\VHF\1 C/B G09 on 49 VU, COM NAV\VHF\2 C/B L04 on 121 VU, COM \VHF\3 C/B L05 on 121 VU.

[QRH] TOO HOT COCKPIT AND CABIN TEMPERATURE IN FLIGHT

Ident.: PRO-ABN-COND-00010753.0002001 / 04 NOV 20
Applicable to: ALL

Apply the procedure if the cockpit and cabin temperature becomes too hot with the temperature selector at its maximum cold selection:

PACKS OUTLET TEMP [BLEED SD page].. CHECK

- **If difference between both packs at or above 10 °C:**

  PACK WITH THE HIGHEST OUTLET TEMP...OFF

  A difference between both packs of 10 °C or greater than 10 °C may reflect a contamination of packs resulting in too hot cabin and cockpit air temperature. The situation may be alleviated by switching OFF the pack discharging the hottest air.

Use the sideslip indication to reset the rudder trim if necessary. Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim.

APU START...CONSIDER

■ **If first officer PFD, ND, lower ECAM or MCDU 2 affected:**

GEN 2...OFF

■ **If DUs flash continues :**

GEN 2...ON

■ **If DUs flash stops :**

KEEP GEN 2 OFF

Keep the generator OFF for the rest of the flight.

RUD TRIM...CHECK/RESET

Use the sideslip indication to reset the rudder trim if necessary. Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim.

APU START...CONSIDER

■ **If DU blank or distorted:**

DU brightness knob (affected DU)...AS RQRD

Continued on the following page

[QRH] DISPLAY UNIT FAILURE (Cont'd)

The DU can be switched off.

CONSIDER ECAM/ND XFR

CONSIDER PFD/ND XFR

■ **If diagonal line on affected DU:**

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

CONSIDER EIS DMC SWITCHING

● **If unsuccessful:**

DU brightness knob (affected DU).. OFF THEN ON

Note: The ND display may disappear if too many waypoints and associated information are displayed. Reduce ND range, or deselect WPT or CSTR, and the ND display may automatically recover, after about 30 s.

■ **If inversion of E/WD and SD:**

ECAM UPPER DISPLAY brightness knob...OFF THEN ON

The same action on the ECAM LOWER DISPLAY brightness knob produces the same effect.

[QRH] C/B TRIPPED

Ident.: PRO-ABN-ELEC-00012643.0001001 / 17 MAR 17
Applicable to: ALL

- **On ground:**
  Do not reengage the circuit breaker (C/B) of the fuel pump(s) of any tank. For all other C/B, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause is identified.
- **In flight:**
  Do not reengage a circuit breaker (C/B), unless the captain judges it necessary to do so for the safe continuation of the flight. Only one reengagement should be attempted.

61

L2 AC BUS 1 normally supplies the AC ESS BUS and, through TR1, the DC ESS BUS. In the case of an AC BUS 1 FAULT, both the AC and DC ESS BUS will be lost and therefore the AC ESS BUS FAULT and the DC ESS BUS FAULT will be displayed on the ECAM.
However, for aircraft equipped with AC ESS FEED Auto Switching ⊲ , the AC ESS BUS and the DC ESS BUS will automatically recover, due to the fact that the AC BUS 2 will automatically supply the AC ESS BUS.
The flight crew can manually recover the AC ESS BUS and the DC ESS BUS by setting the AC ESS FEED pb-sw to ALTN, as requested by the AC ESS BUS FAULT ECAM procedure

L2 AC BUS 1 normally supplies the AC ESS BUS and, through TR1, the DC ESS BUS. In the case of an AC BUS 1 FAULT, both the AC and DC ESS BUS will be lost and therefore the AC ESS BUS FAULT and the DC ESS BUS FAULT will be displayed on the ECAM.
However, for aircraft equipped with AC ESS FEED Auto Switching ⧏ , the AC ESS BUS and the DC ESS BUS will automatically recover, due to the fact that the AC BUS 2 will automatically supply the AC ESS BUS.
The flight crew can manually recover the AC ESS BUS and the DC ESS BUS by setting the AC ESS FEED pb-sw to ALTN, as requested by the AC ESS BUS FAULT ECAM procedure

ECAM Control Panel

Note: 1. *The warning may be caused by a sub BUS failure. Consequently, only a part of the above-listed systems may be lost.*
2. *Even if the ECAM Status page displays CAT 3 SINGLE ONLY, the real landing capability of the aircraft is CAT 2, due to the inoperative A/THR (Refer to QRH/OPS Required Equipment for CAT2 and CAT3). Once the approach mode is armed, the FMA displays the correct landing capability CAT 2.*

(1) *Autothrust, eng start and reverser inop.*

(2) *This message is triggered when the failure (or combination of failures) affects the nominal aerodynamic characteristics of the aircraft.*

(3) *Disregard FMS fuel predictions and Refer to QRH/OPS Fuel Penalty Factors/ECAM Alert Table in order to find the applicable fuel penalty factor.*

143

LAND ASAP

MIN RAT SPEED....................140 KT

CAUTION	*The RAT is capable of supplying the EMER GEN down to 125 kt, except during flare.*

GEN 1 + 2....................OFF THEN ON

Note: Turn off then on all generators one after the other.

- **IF UNSUCCESSFUL:**

  BUS TIE....................OFF

L2 *Setting BUS TIE pb-sw to OFF segregates both generator channels.*

L1 GEN 1 + 2....................OFF THEN ON

Note:
- *Turn off then on all generators one after the other*
- *If any generator reset is successful, reset both FACs.*

EMER ELEC PWR (IF EMER GEN NOT IN LINE).................... MAN ON
ENG MODE SEL....................IGN

L2 *Engines are fed by gravity only.*

L1 VHF1/HF1 ◁ /ATC1....................USE

L2 *Only VHF 1, HF 1 and ATC 1 are supplied in the electrical emergency configuration.*

L1 *Note: The flight crew can recover FMGC 1, which is lost temporarily, through the MCDU MENU page.*

FUEL GRVTY FEED

L2 *Engines are fed by gravity only. Avoid negative Gs.*

L1 PROC: GRVTY FUEL FEEDING

L2 *Apply GRVTY FUEL FEEDING procedure (Refer to PRO-ABN-FUEL [QRH] GRAVITY FUEL FEEDING).*

L1 FAC 1.................... OFF THEN ON

L2 *The rudder trim is recovered, although no indication is available.*

L1 BUS TIE....................AUTO

L2 *Setting BUS TIE pb-sw to AUTO enables the APU to take an available electrical channel.*

L1 APU (IF AVAIL).................... START

Continued on the following page

ELEC EMER CONFIG (Cont'd)

L2 *APU start is not available for 45 s after the loss of both engine generators. This 45 s delay prevents any interference with emergency generator coupling.*
If the APU is available, the APU may be started when below FL 250.

L1 BLOWER + EXTRACT......................................OVRD

L2 *Cooling air is supplied by the air conditioning system and exhausted overboard through the extract valve.*

L1 FUEL CONSUMPT INCRSD
FMS PRED UNRELIABLE

Note: On IAE powered aircraft, the ENG 1(2) EPR MODE FAULT N1 DEGRADED MODE alert is displayed.

ASSOCIATED PROCEDURES

FLT CTL ALTN LAW
(PROT LOST)

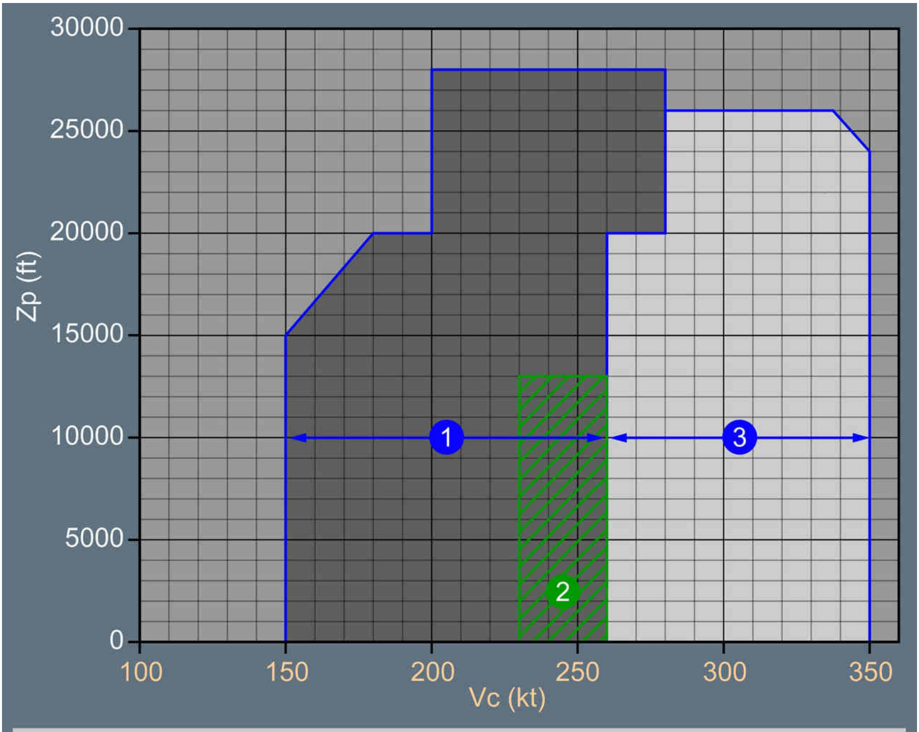
[QRH] ENG RELIGHT
IN FLIGHT

Ident.: PRO-ABN-ENG-00012594.0040001 / 13 DEC 17

1 **Applicable to: MSN 08495-09324, 10949-11597**



Caption:
① STARTER ASSISTED RELIGHT
② WINDMILL QUICK RELIGHT T < 20 s N2 > 15%
③ STABILIZED WINDMILL RELIGHT N2 > 8.5%

No attempt should be made to restart an engine, if there are indications of engine damage, if the engine had been shut down because of an engine fire, or if there is a recognizable possibility that an attempted relight may result in fire.

ENG MASTER (affected engine).. OFF
THR LEVER (affected engine)...Check IDLE

Continued on the following page

[QRH] ENG RELIGHT (Cont'd)

IN FLIGHT

ENG MODE sel...IGN
X BLEED...OPEN

If outside the windmilling start envelope, the FADEC will open the starter valve.

WING ANTI ICE (for starter assist)...OFF
ENG MASTER (affected engine)...ON
ENG PARAMETERS (N2, EGT)...MONITOR

Engine light up should be achieved within 30 s after fuel flow increases.

AUTOMATIC START ABORT NOT AVAIL

Be aware that, contrary to an autostart on ground, the flight crew must take appropriate action in case of an abnormal start.
During engine relight, a rapid EGT increase below the EGT limit may occur. In this case, do not abort the engine relight unless the EGT exceeds the red line indication.

● **If ENG 1(2) START FAULT - ENG STALL triggers, and ENG parameters normal:**
DISREGARD ECAM ALERT

■ **When idle reached (ENG AVAIL):**
ENG MODE sel...NORM
TCAS MODE sel...TA/RA

Check that the selector is at TA/RA since, if the ENG SHUT DOWN procedure (Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN) has been applied, the TCAS mode selector may have been set to the TA position.

X BLEED...AUTO
Affected SYS...RESTORE

■ **If no relight:**
ENG MASTER (affected engine)...OFF

Wait 30 s before attempting a new start (to drain the engine).
During the relight attempt, if the N2 did not increase, consider increasing speed for windmill relight.

Note: *For an in-flight restart, the FADEC decides whether the rotor speed is sufficient to perform a windmill relight or needs assistance from the starter in view of the current engine parameters and the flight environment parameters. Within the windmill quick relight envelope, if the crew is using the Quick Windmill Relight procedure, the FADEC will restart*

Continued on the following page

[QRH] ENG RELIGHT (Cont'd)

2

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:

- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:

- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

EMER ELEC PWR MAN ON pb....................PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

L1 OPT RELIGHT SPD....................280/0.77

Ident.: PRO-ABN-ENG-AT-00017540.0002001 / 04 NOV 15

L2 *Note:* *In the case of an "ENG ALL ENGINES FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

Continued on the following page

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:
- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:
- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

EMER ELEC PWR MAN ON pb....................PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

L1 OPT RELIGHT SPD....................280/0.77

Ident.: PRO-ABN-ENG-AT-00017540.0002001 / 04 NOV 15

L2 *Note:* *In the case of an "ENG ALL ENGINES FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

Continued on the following page

Ident.: PRO-ABN-ENG-AT-00017524.0005001 / 17 MAR 17

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:
- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:
- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

EMER ELEC PWR MAN ON pb..PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

L1 OPT RELIGHT SPD..300/0.77

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:
- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:
- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

EMER ELEC PWR MAN ON pb..PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

Ident.: PRO-ABN-ENG-AT-00017524.0005001 / 17 MAR 17

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:
- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:
- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

EMER ELEC PWR MAN ON pb..........PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

L1 OPT RELIGHT SPD..........300/0.77

Ident.: PRO-ABN-ENG-AT-00017541.0006001 / 17 MAR 17

L2 The flight crew must apply this paper procedure when required by the ENG ALL ENGINES FAILURE ECAM alert.

During the application of the ALL ENGINES FAILURE paper procedure:
- If one or more engines relight, apply the corresponding ECAM procedure instead, or
- If none of the engines relights, continue to apply the ALL ENGINES FAILURE paper procedure. If there is sufficient time, clear both the ECAM alerts and the ECAM STATUS page.

The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator.

The ALL ENGINES FAILURE paper procedure includes a fuel quantity check to determine if either of the following applies:
- Engine relight can be attempted, or
- Engine relight cannot be attempted.

If engine relight can be attempted, the flight crew can attempt successive engine relights. First without the APU bleed (windmill start), then with the APU bleed, if available.
If engine relight cannot be attempted, the flight crew must apply the procedure for forced landing or ditching.

L1 First apply the following actions of the ENG ALL ENGINES FAILURE ECAM procedure (if not already applied):

LAND ASAP

EMER ELEC PWR MAN ON pb..PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

60 000 kg/132 000 lb	*-1.5*
70 000 kg/154 000 lb	*-0.5*

AVERAGE GLIDING DISTANCE : 2.2 NM / 1000 FT (280kt NO WIND)

DETERMINE LANDING STRATEGY

VHF1/HF1 ◁ /ATC1.......... USE

ATC.......... NOTIFY

Notify air traffic control of the nature of the emergency, and state intentions. Switch to code A7700, or transmit a distress message on one of the following frequencies: VHF frequency 121.5 MHz, HF 2 182 kHz or 8 364 kHz.

- **If no relight after 30 s:**

  ENG MASTERS.......... OFF 30 S / ON

  Unassisted start attempts can be repeated until successful, or until APU bleed is available.

- **If unsuccessful:**

  CREW OXY MASKS (above FL 100).......... ON

  Cabin altitude will increase, due to the lack of engine bleed: The EXCESS CAB ALT warning could be triggered. Depending on the situation, to gain gliding distance, the flight crew may disregard the ECAM emergency descent requirement, because passengers will be provided with oxygen for a sufficient period of time.

  APU (IF AVAIL).......... START

  If APU is available, APU may be started when below FL 250 and APU BLEED may be used for engine start below FL 200.

  WING ANTI ICE.......... OFF

  APU BLEED.......... ON

Continued on the following page

[QRH] ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **In sequence:**

  ENG MASTERS (all non running engines)....OFF

  After 30 s

  ENG MASTERS (one at a time)....ON

  Between each attempt to relight the same engine, wait at least 30 s with the associated ENG MASTER lever set to OFF.

[QRH] ENG 1(2) STALL

Ident.: PRO-ABN-ENG-00015730.0002001 / 05 MAR 19

56 **Applicable to: MSN 08495-09324, 10949-11597**

This crew must apply this procedure when instructed by ECAM, or if they detect an engine stall before FADEC:

- **On Ground:**
  THR LEVER (affected engine)....IDLE
  ENG MASTER (effected engine)....OFF
- **In Flight:**
  THR LEVER (affected engine)....IDLE
  ENG PARAMETERS (affected engine)....CHECK
  - **If abnormal ENG parameters:**
    ENG MASTER (affected engine).... OFF
    ENG 1(2) SHUT DOWN
    Apply the ENG SHUT DOWN ECAM procedure (Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN). Engine restart at crew discretion.
  - **If normal ENG parameters:**
    WING ANTI ICE....ON
    Operation of ENG and WING ANTI ICE will increase the stall margin but EGT increases accordingly.
    THR LEVER (affected engine)....SLOWLY MOVE FORWARD
    - **If stall recurs:**
      THR LEVER (affected engine)....MOVE BACKWARD
      Reduce thrust and operate below the thrust threshold where stall recurs.
    - **If stall does not recur:**
      CONTINUE NORMAL ENGINE OPERATION

[QRH] ENG 1(2) STALL

Ident.: PRO-ABN-ENG-00015730.0001001 / 05 MAR 19

Applicable to: MSN 01143-01246, 01376-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321, 02734-03710, 03733-05987, 06097, 06121, 06139-06536, 06592-07098

This crew must apply this procedure when instructed by ECAM, or if they detect an engine stall before FADEC:

- **On Ground:**
  THR LEVER (affected engine)....IDLE
  ENG MASTER (affected engine)....OFF
- **In Flight:**
  THR LEVER (affected engine)....IDLE
  ENG PARAMETERS (affected engine)....CHECK
  - **If abnormal ENG parameters:**
    ENG MASTER (AFFECTED ENGINE)....OFF
    ENG 1(2) SHUT DOWN
    Apply the ENG SHUT DOWN ECAM procedure (Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN). Engine restart at crew discretion.
  - **If normal ENG parameters:**
    ENG ANTI ICE (affected engine)....ON
    Operation of ENG and WING ANTI ICE will increase the stall margin but EGT increases accordingly.
    THR LEVER (affected engine)....SLOWLY MOVE FORWARD
    - **If stall recurs:**
      THR LEVER (affected engine)....MOVE BACKWARD
      Reduce thrust and operate below the thrust threshold where stall recurs.
    - **If stall does not recur:**
      CONTINUE NORMAL ENGINE OPERATION

[QRH] ENGINE TAILPIPE FIRE

Ident.: PRO-ABN-ENG-00017781.0001001 / 17 MAR 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

Internal engine fire may be encountered during engine start or engine shutdown.
Internal engine fire may be seen by the ground crew, or the EGT may fail to decrease after the ENG MASTER lever is set to OFF.

CAUTION	External fire agents can cause severe corrosive damage. Consider the use of external fire agents only if the following procedure does not stop engine tailpipe fire.

ENG MASTER (affected engine) .... OFF

Note: *Do not press the engine fire pushbutton, since this would cut off the FADEC power supply, which would prevent motoring sequence.*

ENG MAN START pb (affected engine) .... OFF
ESTABLISH AIR BLEED PRESS

Select the APU, or opposite BLEED, to motor the engine.
If APU BLEED is not available, and the opposite engine is shut down, connect external pneumatic power (if readily available).

BEACON .... ON
ENG MODE sel .... CRANK
ENG MAN START pb (affected engine) .... ON

For aircraft equipped with IAE or PW6000 engines, the start valve automatically reopens, when N2 is below 10 %.
For aircraft equipped with CFM 56-5A/5B engines, the start valve automatically reopens, when N2 is below 20 %
For aircraft equipped with CFM LEAP-1A engines, the start valve automatically reopens, when N2 is below approximately 60 %

- **When fire stopped:**
  ENG MAN START pb (affected engine) .... OFF
  ENG MODE sel .... NORM

  Maintenance action is due.

[QRH] ENGINE TAILPIPE FIRE

Ident.: PRO-ABN-ENG-00017781.0002001 / 17 MAR 17

57 **Applicable to: MSN 08495-09324, 10949-11597**

Internal engine fire may be encountered during engine start or engine shutdown.
Internal engine fire may be seen by the ground crew, or the EGT may fail to decrease after the ENG MASTER lever is set to OFF.

CAUTION	External fire agents can cause severe corrosive damage. Consider the use of external fire agents only if the following procedure does not stop engine tailpipe fire.

ENG MASTER (affected engine) .... OFF

Note: *Do not press the engine fire pushbutton, since this would cut off the FADEC power supply, which would prevent motoring sequence.*

ENG MAN START pb (affected engine).......... OFF
ESTABLISH AIR BLEED PRESS

Select the APU, or opposite BLEED, to motor the engine.
If APU BLEED is not available, and the opposite engine is shut down, connect external pneumatic power (if readily available).

BEACON .... ON
ENG MODE sel.......... CRANK
ENG MAN START pb (affected engine).......... ON

The start valve automatically reopens, when N2 is below 15 %.

- **When fire stopped:**
  ENG MAN START pb (affected engine).......... OFF
  ENG MODE sel.......... NORM

  Maintenance action is due.

[QRH] HIGH ENGINE VIBRATION

Ident.: PRO-ABN-ENG-00012294.0006001 / 19 SEP 17
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

The VIB advisory on ECAM (N1 ≥ 6 units, N2 ≥ 4.3 units) is mainly a guideline for the flight crew to monitor engine parameters more closely.
The ECAM vibration advisory alone does not require engine shut down.

Note: 1. *High engine vibration may be accompanied by cockpit and cabin smoke and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.*
2. *High N1 vibration are generally accompanied by perceivable airframe vibrations. High N2 vibration can occur without perceivable airframe vibrations.*

ENG PARAMETERS .... CHECK

Check engine parameters and especially EGT; crosscheck with other engine. Report in maintenance log.

- **If icing suspected:**

  An increase of engine vibration in icing conditions with or without engine anti-ice may be due to fan blades and/or spinner icing. Icing may be suspected if N1 vibration occurs without other engine parameters variation.

  A/THR .... OFF
  THRUST (one engine at a time).......... IDLE THEN INCREASE N1 > 80 %

  Reduce thrust to idle if flight conditions permit.
  If ENG ANTI ICE is off, switch it ON ***at idle fan speed,*** *one engine after the other with approximately 30 s interval.*
  To shed ice, it may be necessary to perform several thrust variations between idle and a thrust compatible with the flight phase. For efficient ice shedding, thrust should be increased to at least 80% N1 if flight conditions permit.
  After each thrust variation, vibrations should decrease, indicating the progress of the ice shedding.
  When the ice is shed, vibrations should return to normal and the flight crew can resume normal engine operation.

- **If icing not suspected:**
  - **If above vibration advisory and flight conditions permit:**
    THRUST (affected engine).......... REDUCE BELOW ADVISORY THRESHOLD

- **After landing, if vibrations continue :** SHUT DOWN ENGINE WHEN POSSIBLE

Continued on the following page

[QRH] HIGH ENGINE VIBRATION (Cont'd)

[QRH] HIGH ENGINE VIBRATION

Ident.: PRO-ABN-ENG-00012294.0001001 / 19 SEP 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

The VIB advisory on ECAM (N1 ≥ 5 units, N2 ≥ 5 units) is mainly a guideline for the flight crew to monitor engine parameters more closely.

■ **On ground, during ENG start if N2 VIB > 6.5:**

ENG MASTER (affected engine)..........OFF

A maximum of three new start attempts can be performed. Each start attempt must be initiated after the engine has completely spooled down.

● **If still N2 VIB after third new start attempt:** REQUEST MAINTENANCE ACTION

Report in log book any N2 vibration above 5.

■ **In all other cases of high N1 or N2 vibrations:**

The ECAM vibration advisory alone does not require engine shut down.

Note: 1. *High engine vibration may be accompanied by cockpit and cabin smoke and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.*
2. *High N1 vibration are generally accompanied by perceivable airframe vibrations. High N2 vibration can occur without perceivable airframe vibrations.*

ENG PARAMETERS ....CHECK

Check engine parameters and especially EGT; crosscheck with other engine. Report in maintenance log.

■ **If icing suspected:**

An increase of engine vibration in icing conditions with or without engine anti-ice may be due to fan blades and/or spinner icing. Icing may be suspected if N1 vibration occurs without other engine parameters variation.

A/THR ....OFF
THRUST (one engine at a time)..........IDLE THEN INCREASE N1 > 90 %

Reduce thrust to idle if flight conditions permit.
*If ENG ANTI ICE is off, switch it ON **at idle fan speed,** one engine after the other with approximately 30 s interval.*

Continued on the following page

[QRH] HIGH ENGINE VIBRATION (Cont'd)

To shed ice, it may be necessary to perform several thrust variations between idle and a thrust compatible with the flight phase. If VIB are still above the advisory at idle, set thrust temporarily to 90% N1 if flight conditions permit.
After each thrust variation, vibrations should decrease, indicating the progress of the ice shedding.
When the ice is shed, vibrations should return to normal and the flight crew can resume normal engine operation.

- ■ **If icing not suspected:**
  - ● **If above vibration advisory and flight conditions permit:**
    THRUST (affected engine)............................. REDUCE BELOW ADVISORY THRESHOLD
- ● **After landing, if vibrations continue :** SHUT DOWN ENGINE WHEN POSSIBLE

[QRH] HIGH ENGINE VIBRATION

Ident.: PRO-ABN-ENG-00012294.0010001 / 17 MAY 21

58 **Applicable to: MSN 08495-09324, 10949-11597**

The flight crew must apply this procedure when instructed by ECAM, or if they detect high engine vibration.
The triggering of the ENG 1(2) HIGH VIB alert is mainly a guideline for the flight crew to monitor engine parameters more closely: The triggering of the ECAM alert alone does not require engine shut down

Note: 1. *High engine vibration may be accompanied by cockpit and cabin smoke and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.*
2. *High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.*

■ **On ground, during ENG start if N2 VIB> 5:**

ENG MASTER (affected engine)........OFF

REQUEST MAINTENANCE ACTION

Report in log book any N2 vibrations above 5.

■ **In all other cases of high N1 or N2 vibrations:**

ENG PARAMETERS ....CHECK

Check engine parameters and especially EGT; crosscheck with other engine. Report in maintenance log.

■ **If icing suspected:**

An increase of engine vibration in icing conditions with or without engine anti-ice may be due to fan blades and/or spinner icing. Icing may be suspected if N1 vibration occurs without other engine parameters variation.

A/THR ....OFF
THRUST (one engine at a time)........IDLE THEN INCREASE N1 > 80 %

Reduce thrust to idle if flight conditions permit.
If ENG ANTI ICE is off, switch it ON ***at idle fan speed,*** *one engine after the other with approximately 30 s interval.*
To shed ice, it may be necessary to perform several thrust variations between idle and a thrust compatible with the flight phase. For efficient ice shedding, thrust should be increased to at least 80% N1 if flight conditions permit.
After each thrust variation, vibrations should decrease, indicating the progress of the ice shedding.

Continued on the following page

[QRH] HIGH ENGINE VIBRATION (Cont'd)

When the ice is shed, vibrations should return to normal and the flight crew can resume normal engine operation.

- ■ **If icing not suspected:**
  - ● **If VIB indication(s) amber:**

    THRUST (affected engine).. REDUCE

    If flight conditions permit, reduce thrust to maintain vibration level below the amber threshold. If the VIB indication does not decrease following thrust reduction, this may indicate other problems on the engine.
    Transient high N2 vibrations have been reported, mostly in climb with all other engine parameters normal. They may occur several times in one flight. When the vibration level is stabilized below the amber threshold, thrust may be increased again while monitoring the VIB indication.

- ● **After landing, if vibrations continue:** SHUT DOWN ENGINE WHEN POSSIBLE

[QRH] ON GROUND - NON ENG SHUTDOWN AFTER ENG MASTER OFF

Ident.: PRO-ABN-ENG-00020795.0001001 / 30 MAR 18
Applicable to: ALL

The normal procedure to shut down an engine is to set the ENG MASTER lever to OFF. In the case where the engine does not shut down as expected, use the following procedure:

ECAM FUEL PAGE..SELECT
LP FUEL VALVE POSITION (affected engine)..CHECK

- ■ **If LP fuel valve closed (cross line amber):**

  NO CREW ACTION

- ■ **If LP fuel valve open:**

  ENG FIRE pb-sw (affected engine)..PRESS

  Using the ENG FIRE pb-sw will force the LP fuel valve to close. The engine will shut down after a time delay.

GROUND CREW..NOTIFY

IN BOTH CASES, ENGINE WILL SHUT DOWN AFTER A TIME DELAY UP TO 2 MIN 30 S
The engine shuts down when the remaining fuel between the LP fuel valve and the nozzles is burned. The time delay for engine shutdown depends on airport altitude and fuel recirculation system operation.

[QRH] ONE ENGINE INOPERATIVE - CIRCLING APPROACH

● **If aircraft weight above maximum weight for circling in CONF 3 with gear down:**

DELAY GEAR EXTENSION TO MAINTAIN LEVEL FLIGHT

The aircraft cannot maintain level flight, in CONF 3 and with the landing gear down.

FOR LANDING: USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..ON

Note: - *If circling below 750 ft RA, “L/G GEAR NOT DOWN” alert will trigger. The pilot can cancel the aural warning by pressing the EMER CANC pb.*
- *If the landing gear is not downlocked at 500 ft RA, GPWS "TOO LOW GEAR” aural alert will trigger.*

62

L2 The ENG ALL ENGINES FAILURE ECAM alert inhibits the ELEC EMER CONFIG ECAM alert, and provides the flight crew with an associated procedure to immediately apply in the case of a failure of all engines. The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator. Then, the ENG ALL ENGINES FAILURE ECAM procedure specifies that the flight crew must apply the ALL ENGINES FAILURE QRH procedure.

L1 **LAND ASAP**

EMER ELEC PWR MAN ON PB.. PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

L1 OPT RELIGHT SPD.. 280/0.77

L2 *In the case of a speed indication failure due to volcanic ash, the pitch altitude for optimum relight is provided in the QRH procedure.*

Ident.: PRO-ABN-ENG-AS-00017522.0002001 / 04 NOV 15

L2 *Note:* *In the case of an "ENG ALL ENGINES FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

Continued on the following page

70

L2 The ENG ALL ENGINES FAILURE ECAM alert inhibits the ELEC EMER CONFIG ECAM alert, and provides the flight crew with an associated procedure to immediately apply in the case of a failure of all engines. The purpose of the ENG ALL ENGINES FAILURE ECAM procedure is to secure both the automatic extension of the RAT and the automatic connection of the emergency generator. Then, the ENG ALL ENGINES FAILURE ECAM procedure specifies that the flight crew must apply the ALL ENGINES FAILURE QRH procedure.

L1 **LAND ASAP**

EMER ELEC PWR MAN ON PB..PRESS

L2 *Set the EMER ELEC PWR pb to MAN ON to enable both the RAT extension and the emergency generator connection.*

L1 OPT RELIGHT SPD..280/0.77

L2 *In the case of a speed indication failure due to volcanic ash, the pitch altitude for optimum relight is provided in the QRH procedure.*

Ident.: PRO-ABN-ENG-AS-00017523.0003001 / 21 MAR 17

ENG DUAL FAILURE (Cont'd)

Ident.: PRO-ABN-ENG-S-00012282.0291001 / 21 MAR 17

L2 The ENG DUAL FAILURE warning inhibits the ELEC EMER CONFIG warning.
The FCOM Procedure includes all steps of the ECAM ENG DUAL FAILURE procedure.

However, to facilitate handling of all the ECAM procedures associated with a dual engine failure, it is recommended using the ENG DUAL FAILURE QRH procedure that also includes the DITCHING and FORCED LANDING procedures. When applying the ENG DUAL FAILURE QRH procedure:
- If one or more engines are recovered, apply the corresponding ECAM procedure instead
- If no engines are recovered, continue to apply the ENG DUAL FAILURE QRH procedure. If time permits, clear ECAM alerts, and check the ECAM STATUS page.

L1 **LAND ASAP**

ENG MODE SEL...IGN

L2 *An immediate relight attempt is made.*

L1 THR LEVERS...IDLE

OPTIMUM RELIGHT SPD...280 KT

L2 *The optimum airspeed to allow an effective windmilling start attempt is 280 kt.*

Note: *In the case of an “ENG DUAL FAILURE” during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

In case of a speed indication failure (volcanic ash), the pitch attitude for optimum relight speed is 2.5 ° down. For weight above 50 000 kg/110 000 lb, raise the nose by 1 ° for every additional 10 000 kg/22 000 lb (e.g. if weight is 60 000 kg/132 000 lb pitch is 1.5 ° down).

At 280 kt, the aircraft can fly up to about:
- *2.2 NM per 1 000 ft at 50 000 kg/110 000 lb*
- *2.5 NM per 1 000 ft at 60 000 kg/132 000 lb*
- *2.7 NM per 1 000 ft at 70 000 kg/154 000 lb*

L1 EMER ELEC PWR (IF EMER GEN NOT IN LINE)...MAN ON

L2 *Pressing EMER ELEC PWR MAN ON pb allows extension of RAT and emer gen coupling.*

L1 VHF 1/HF 1 /ATC 1...USE

L2 - *In Elec emer configuration only VHF 1, HF 1 and ATC 1 are supplied.*

L2 - *Notify traffic control of the nature of the emergency and state intention.*
If there is no contact with air traffic control switch to code A7700 or transmit a distress message on one of the following frequencies, VHF frequency 121.5 MHz, HF 2 182 kHz or 8 364 kHz.

Continued on the following page

ENG DUAL FAILURE (Cont'd)

L1 FAC 1 .... OFF THEN ON

L2 *Aircraft is out of trim due to right aileron up float.*
Resetting FAC 1 permits to recover rudder trim even if no indication is available.

L1
- **IF NO RELIGHT AFTER 30 S:**

  ENG MASTERS .... OFF 30 S/ON

L2 *Engine masters must be left OFF for 30 s to allow ventilation of combustion chamber.*

L1
  - **If UNSUCCESSFUL:**

    APU (IF AVAIL) .... START

L2 *If the APU is available, APU may be started when below FL 250, and APU BLEED may be used for engine start below FL 200 if the speed is ≥ 180 kt , or below FL 150 if the speed is < 150 kt.*
APU start is unavailable for 45 s after the loss of both engine generators. This 45 s delay prevents any interference with emergency generator coupling.

ENG DUAL FAILURE (Cont'd)

Ident.: PRO-ABN-ENG-S-00012282.0380001 / 21 MAR 17

L2 This warning inhibits the ELEC EMER CONFIG warning, and provides the flight crew with the immediate actions to take in the case of a dual engine failure. This procedure then directs the flight crew to apply the applicable QRH procedure, depending on if there is fuel or not.

When applying the ENG DUAL FAILURE QRH procedure:
- If one or more engines are recovered, apply the corresponding ECAM procedure instead
- If no engines are recovered, continue to apply the ENG DUAL FAILURE QRH procedure. If time permits, clear ECAM alerts, and check the ECAM STATUS page.

L1 **LAND ASAP**

EMER ELEC PWR (IF EMER GEN NOT IN LINE)........MAN ON

L2 *Pressing EMER ELEC PWR MAN ON pb allows extension of RAT and emergency generator coupling.*

L1 THR LEVERS........IDLE
FAC 1........OFF THEN ON

L2 *Resetting FAC 1 enables the recovery of characteristics speed displayed on the PFD.*
Resetting FAC 1 also enables rudder trim recovery, even if no indication is available.
When the hydraulic power is lost, the right aileron is lost, and is in the upfloat position.
Rudder trim may be used to compensate for this upfloating aileron.

L1 ■ **IF NO FUEL:**

OPT SPD........220 KT/GREEN DOT

L2 *If there is no fuel remaining, the optimum speed is the green dot speed.*
Initially fly 220 kt then refer to the QRH procedure to get the accurate green dot speed.

L1 ENG/NO FUEL PROC........APPLY

L2 *Refer to procedure.*

L1 ■ **IF FUEL REMAINS:**

ENG MODE SEL........IGN
OPT RELIGHT SPD........280 KT

L2 *If there is fuel remaining, the optimum speed is the optimum relight speed.*

Note: *In the case of an "ENG DUAL FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

Continued on the following page

ENG DUAL FAILURE (Cont'd)

The ECAM provides reference to an envelope speed. In case of speed indication failure (volcanic ash), pitch attitude for optimum relight is provided in the QRH procedure.

L1 ENG/FUEL PROC.. APPLY

L2 *Refer to procedure.*

L2 This warning inhibits the ELEC EMER CONFIG warning, and provides the flight crew with the immediate actions to take in the case of a dual engine failure. This procedure then directs the flight crew to apply the applicable QRH procedure, depending on if there is fuel or not.

When applying the ENG DUAL FAILURE QRH procedure:

- If one or more engines are recovered, apply the corresponding ECAM procedure instead
- If no engines are recovered, continue to apply the ENG DUAL FAILURE QRH procedure. If time permits, clear ECAM alerts, and check the ECAM STATUS page.

ENG 1(2) FAIL (Cont'd)

Ident.: PRO-ABN-ENG-BJ-00017667.0003001 / 04 JUN 19

L2 An engine flame-out may be recognized by a rapid decrease in EGT, N2, FF, followed by decrease in N1 for CFM engines, or EPR for IAE engines.

The flight crew can suspect an engine damage if the flight crew observes two or more of the following symptoms:

- Rapid increase of EGT above the red line
- Important mismatch of the rotor speeds, or absence of rotation
- Significant increase of aircraft vibrations and/or buffeting
- Hydraulic system loss
- Repeated or uncontrollable engine stalls

L1 **LAND ASAP**

■ **Before takeoff or after landing:**

THR LEVER (AFFECTED ENGINE)........ IDLE
ENG MASTER (AFFECTED ENGINE)........OFF

■ **IF DAMAGE:**

ENG FIRE P/B (AFFECTED ENGINE)........ PUSH
AGENT 1........ DISCH

■ **IF NO DAMAGE:**

L2 For CFM engines, if conditions permit, do not restart the engine. A new engine start would erase FADEC troubleshooting data.

L1 ENG (AFFECTED) RELIGHT........CONSIDER

L2 *If no damage, a new start sequence may be initiated.*

L12

ASSOCIATED PROCEDURES

ENG 1(2) **SHUT DOWN**

*Apply the ENG SHUT DOWN procedure (*Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN*), if damage or if engine relight is unsuccessful.*

L1 ■ **In flight:**

ENG MODE SEL........ IGN

L2 *Selection of continuous ignition confirms the immediate relight attempt made by the FADEC.*

L1 THR LEVER (AFFECTED ENGINE)........ IDLE

Continued on the following page

ENG 1(2) FAIL (Cont'd)

L2 *Note: In case of GPWS (EGPWS) alerts, reduce speed with care below VLS with flaps extended (at light weights VMCA may be reached before αMax) when applying the GPWS (EGPWS) procedure.*

L1 ● **IF NO ENG RELIGHT AFTER 30 S:**

L2 The 30 s countdown starts as soon as the ENG 1(2) FAIL alert is triggered.

L1 ENG MASTER (AFFECTED ENGINE)..OFF

■ **IF DAMAGE:**

ENG FIRE P/B (AFFECTED ENGINE)..PUSH

AGENT 1 (AFTER 10 SECONDS IN FLIGHT)..DISCH

L12

ASSOCIATED PROCEDURES

ENG 1(2) **SHUT DOWN**

L2 *Apply the ENG SHUT DOWN procedure (Refer to PRO-ABN-ENG ENG 1(2) SHUT DOWN), if damage or if engine relight is unsuccessful.*

If high vibration occurs and continues after engine shutdown, reduce airspeed and descent to a safe altitude.

Attempt to determine and use a practical airspeed and altitude for minimum vibrations.

L1 ■ **IF NO DAMAGE:**

ENG (AFFECTED) RELIGHT..CONSIDER

ENG 1(2) FAIL (Cont'd)

Ident.: PRO-ABN-ENG-BJ-00017667.0004001 / 04 JUN 19

L2 An engine flame-out may be recognized by a rapid decrease in EGT, N2, FF, followed by decrease in N1.

The flight crew can suspect an engine damage if the flight crew observes two or more of the following symptoms:
- Rapid increase of EGT above the red line
- Important mismatch of the rotor speeds, or absence of rotation
- Significant increase of aircraft vibrations and/or buffeting
- Hydraulic system loss
- Repeated or uncontrollable engine stalls

L1

LAND ASAP

■ **If shaft shear detected:**

SHAFT FAILURE

■ **In case of a thrust malfunction:**

THRUST MALFUNCTION

L2 *On ground, an overthrust condition is detected by the FADEC, which automatically shuts down the engine.*

L1 ENG MASTER (AFFECTED ENGINE)....................OFF

■ **Before takeoff or after landing:**

133

L2 This alert could indicate a fuel leak downstream of the Fuel Metering Valve (FMV). In such a case, the FUEL F. USED/FOB DISAGREE alert will not be triggered. A low N1 indication may indicate a fuel leak. The flight crew should check fuel parameters to confirm the leak. Check parameters like FOB, FU, fuel flow, fuel distribution, fuel imbalance to confirm the leak.

L1 ● **IF LEAK CONFIRMED:**

THR LEVER (AFFECTED ENGINE)... IDLE
ENG MASTER (AFFECTED ENGINE)...OFF

L2 Loss of engine control sensors (N1 or N2 or T2 or P2, etc).

L1 N1 DEGRADED MODE

NOT EXCEED N1 LIMIT.

L2 *There is no N1 limit. Therefore an overboost can occur if the thrust lever is moved fully forward.*

L1 MAN THR.. ADJUST

L2 *Align the N1 of the affected engine with the N1 of the other engine.*

L1
- **On ground:**

  THR LEVER (AFFECTED).. IDLE
  ENG MASTER (AFFECTED)..OFF

- **In flight:**

  AVOID RAPID THR CHANGES.

221

This alert is triggered when FADEC detects an engine stall. Indications of an engine stall include varying degrees of abnormal engine noises/bangs, accompanied by flame from the engine exhaust (and possibly from the engine inlet in severe case), fluctuating performance parameters, vibration, sluggish or no thrust lever response, high EGT and/or a rapid EGT rise when thrust lever is advanced. Engine stalls must be reported for maintenance action.

ENG 1(2) START FAULT (Cont'd)

L1 ● **On ground (auto start):**

L2 If the FADEC detects a stall or a potential EGT overheat, the FADEC will reduce the fuel schedule in stages, if necessary, to achieve a normal condition. The following message will be displayed on the ECAM:

L1 NEW START IN PROGRESS

● **If restart not possible:**

L2 If normal conditions cannot be achieved, the FADEC shuts off fuel and turn off ignition.

L1 ENG MASTER (AFFECTED)..OFF

L2
- *The fuel metering valve and starter air valve are automatically closed. Both igniters are turned off*
- *Setting ENG MASTER to OFF confirms automatic start abort*
- *In case of ENG STALL, consider making a XBLEED start, if pressure is low.*

L1 ● **On ground (manual start):**

ENG MASTER (AFFECTED)..OFF
MAN START (AFFECTED)..OFF
MODE SEL..CRANK
MAN START (AFFECTED)..ON

L2 Note: *ECAM does not display the last two lines of the above procedure.*
Dry crank the engine for 30 s. The start valve automatically reopens when N2 is below 20 %.
After the starter cools, and for any subsequent attempt to start the engine, the flight crew must perform a manual start, or must report the “no start condition” to maintenance for appropriate action.

L1 ■ **STARTER TIME EXCEEDED:**
MAN START (IF MANUAL START IS PERFORMED)..OFF
ENG MASTER (AFFECTED)..OFF

■ **LO START AIR PRESS:**

ANNUNCIATIONS

Triggering Conditions:

L2

This alert triggers when engine start is failed due to the following conditions:
- No light up, or
- Engine stall, or
- Engine overtemperature, or
- Hung start, or
- No N1 rotation, or
- Starter time exceeded, or
- Thrust lever not at idle, or
- Hot start, or
- Starter shaft shear.

ENG 1(2) START VALVE FAULT (Cont'd)

Ident.: PRO-ABN-ENG-D-00018010.0013001 / 18 NOV 21

231

START VALVE NOT CLOSED

L2 Remove all bleed sources supplying the faulty start valve.

L1 APU BLEED (IF ENG 1 AFFECTED)........ OFF
X BLEED........ SHUT

L2 *This action line is only displayed if ENG 2 is affected or if ENG 1 is affected with ENG 2 supplying bleed through the X BLEED.*

L1
- **In flight:**
  ENG BLEED (AFFECTED)........ OFF
  MAN START (IF MAN START PERFORMED)........ OFF
  WING ANTI ICE........ OFF

  AVOID ICING CONDITIONS
- **On ground:**
  MAN START (IF MAN START PERFORMED)........ OFF
  ENG MASTER (AFFECTED)........ OFF
  DUAL COOLING........ OFF

START VALVE NOT OPEN

- **If opposite engine running:**
  X BLEED........ OPEN
- **If APU AVAIL below FL 200:**
  APU BLEED........ ON
- **IF UNSUCCESSFUL:**
  - **On ground:**
    MAN START (IF MAN START PERFORMED)........ OFF
    ENG MASTER (AFFECTED) (IF AUTO START PERFORMED)........ OFF

    L2 *MAN START procedure is useless since in both cases, the start valve is controlled by FADEC.*

    L1 DUAL COOLING........ OFF
  - **In flight:**
    WINDMILL START ONLY

Continued on the following page

ENG 1(2) START VALVE FAULT (Cont'd)

- ■ **EEC control of start valve failed:**
  - ■ **On ground:**
    START VALVE MAN ONLY
    MAN START (IF MAN START PERFORMED)........OFF
    ENG MASTER (AFFECTED) (IF AUTO START PERFORMED)........OFF
    L2 *MAN START procedure is useless since in both cases, the start valve is controlled by FADEC.*
    L1 DUAL COOLING........OFF
  - ■ **In flight:**
    WINDMILL START ONLY
    L2 *Windmilling start is only available since EEC cannot control the start valve.*

LAND ASAP

- **On the ground:**

  ENG (AFFECTED) IDLE POWER ONLY.

  L2 *Idle power is automatically selected by FADEC.*
  If associated thrust reverser is already deployed, FADEC commands restow.

  L1 THR LEVER (AFFECTED).. IDLE

- **In flight:**

  L2 If the selected thrust lever position at the time of fault detection is:
  TO or FLEX: FADEC freezes TO or FLEX TO thrust until slat retraction. At slat retraction it selects MCT thrust.
  Between IDLE and MCT: in manual thrust setting mode, engine rating freezes at MCT, or IDLE with slats extended (or MN < 0.47 if the FADEC no longer receives the slats position due to EIU failure). It is possible to activate autothrust. If selected, autothrust mode manages thrust between idle and MCT.

  L1 ENG (AFFECTED) AT IDLE

  L2 *For any case of thrust lever fault (TO, FLEX or between IDLE and MCT) the FADEC will command idle thrust for the approach when slats are extended (or when MN < 0.47 if associated EIU is failed). It is independant of the autothrust condition. Thrust of affected engine remains definitively at idle even for go around.*

  L1 THR LEVER (AFFECTED) .... IDLE

  L2 *When slats are extended or MN < 0.47, if on side EIU is failed.*

  L1
  - **A/THR engaged:**

    A/THR.. KEEP ON

  - **A/THR not engaged:**

    ENG (AFFECTED) HI PWR IN MAN THR.

    L2 *Inhibited when the FADEC commands the affected engine at IDLE*

    L1
    - **BEFORE SLATS IN:**

      A/THR .... ON

      HI PWR ONLY

      L2 *If thrust lever angle failed in TO or flex position.*

        ENG 1(2) AT IDLE

        For any case of thrust lever fault (TO, FLEX, or between idle and MCT), the FADEC will command idle thrust for the approach. It is independent of the autothrust condition. The affected engine's thrust remains definitively at idle, even for go-around.
- **In flight, if the TLA is at, or below MCT:**
  ON GND ENG 1(2) MAX PWR: IDLE

  At aircraft touchdown, the FADEC automatically selects IDLE thrust.

LDG DIST PROC..........APPLY

Determine flap lever position for landing

- **Repeat the following until landing configuration is reached:**

  SPD SEL..........VFE NEXT - 5 kt

  AT VFE NEXT: SELECT FLAPS LEVER ONE STEP DOWN

  Note:
  - *OVERSPEED alert, and VLS displayed on the PFD, are computed according to the actual flaps/slats position*
  - *VFE and VFE NEXT are displayed on the PFD according to the FLAPS lever position. If not displayed, use the placard speeds*
  - *In some cases, the recommended speed for go around requested by the procedure might be slightly above the VFE displayed on PFD as the VFE is linked to the S/F lever position. The Overspeed Warning will not be triggered as it takes into account the actual slat/flap position.*
  - *If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered. In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

- **When in landing CONF and in final approach:**

  DECELERATE TO CALCULATED VAPP

  AP BELOW 500 ft AGL : DO NOT USE

- **For Go-around:**

	MAX SPEED				
Flaps Slats	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3

[QRH] LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

- ■ **If SLATS FAULT:**
  - ● **For circuit:**

    MAINTAIN SLATS/FLAPS CONFIGURATION

    Recommended speed: MAX SPEED - 10 kt
  - ● **For diversion:**

    SELECT CLEAN CONFIGURATION

    Recommended speed for flaps retraction: between MAX SPEED - 10 kt and MAX SPEED.

    Recommended diversion speed: MAX SPEED - 10 kt.

    INCREASED FUEL CONSUMPTION
- ■ **If FLAPS FAULT:**
  - ● **For circuit:**

    MAINTAIN SLATS/FLAPS CONFIGURATION

    Recommended speed: MAX SPEED - 10 kt
    - ● **If HYD G+Y SYS LO PR:**

      Maintain speed close to VAPP
  - ● **For diversion:**
    - ■ **If FLAPS jammed at 0:**

      SELECT CLEAN CONFIGURATION

      Recommended speed for slats retraction: between MAX SPEED - 10 kt and MAX SPEED

      USE NORMAL OPERATING SPEEDS
      - ● **If HYD G+Y SYS LO PR:**

        Maintain at least the higher of VAPP or VLS
    - ■ **If FLAPS jammed > 0:**

      MAINTAIN SLAT/FLAP CONFIGURATION

      Recommended speed for diversion: MAX SPEED - 10 kt

      Note: In the case of go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

Continued on the following page

[QRH] LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

- **If HYD G+Y SYS LO PR:**
  Maintain speed close to VAPP

INCREASED FUEL CONSUMPTION

CAUTION	For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by the applicable Fuel Penalty Factor provided in the QRH, to obtain the fuel penalty required to reach the destination in the current configuration. *Refer to QRH/OPS Fuel Penalty Factors/ECAM Alert Table*.

[QRH] RUDDER JAM

Ident.: PRO-ABN-F_CTL-00011807.0001001 / 26 NOV 19
Applicable to: ALL

L2 Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers.

This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals.

Use F/CTL SD page for a visual check of the rudder position.

L1 LDG DIST PROC...APPLY

- **For approach:**

  AVOID LANDING WITH CROSSWIND FROM THE SIDE WHERE THE RUDDER IS DEFLECTED

  MAX CROSSWIND FOR LDG: 15 kt
  AUTO BRK...DO NOT USE

  L2 *Do not use the autobrake, so as not to delay the application of differential braking at landing roll.*

  L1 FOR LANDING...USE NORMAL CONF
  SPEED AND TRAJECTORY...STABILIZE ASAP

- **For landing:**
  DIFFERENTIAL BRAKING...USE ASAP

  REVERSER: SYMMETRIC USE ONLY

  L2 *Use nosewheel steering handle below 70 kt.*

[QRH] STABILIZER JAM

Ident.: PRO-ABN-F_CTL-00011806.0001001 / 17 MAR 17
Applicable to: ALL

L2 The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.
The flight control normal law remains active in this case and there is no ECAM warning.
Apply the following procedure.

L1 AP...OFF
MAN PITCH TRIM...CHECK

L2 *The pitch trim wheel may not be fully jammed, the force needed may be higher than pre-takeoff manual setting.*

L1
- **If MAN PITCH TRIM available:**

  TRIM FOR NEUTRAL ELEV

  L2 *If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on F/CTL SD page).*

L1
- **If MAN PITCH TRIM not available:**

  FOR LANDING: USE FLAP 3

  L2 *Do not select configuration full so as not to degrade the handling qualities.*

Ident.: PRO-ABN-F_CTL-AM-00018509.0001001 / 21 MAR 16

CHECK PRIORITY LOGIC

L2 Check the integrity of flight control priority, as follows (not displayed on ECAM) :

L1 ELAC 1 .... OFF THEN ON

L2 *Note:* *When the ELAC 1 computer is reset on ground, the pitch trim returns to the ground setting position (0 °).*

L1 ELAC 2 .... OFF THEN ON

L2
- **If the warning disappears:**

  CAPT TAKE OVER pb .... PRESS (at least 3 seconds)

  Check that the :
  - *Aural "priority left" message is activated.*
  - *F/O red arrow light is on.*

  CAPT TAKE OVER pb .... RELEASE
  F/O TAKE OVER pb .... PRESS (at least 3 seconds)

  Check that the:
  - *Aural "priority right" message is activated*
  - *CAPT red arrow light is on.*

  F/O TAKE OVER pb .... RELEASE

  Check that the warning does not reappear.

  Note: *There is no need to move the sidestick for the check.*

- **If the warning does not disappear, or if the warning reappears after the above check:**

  Maintenance action is due.

[QRH] FUEL LEAK

Ident.: PRO-ABN-FUEL-00018665.0003001 / 28 MAY 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173

A fuel leak may be detected, if:
- The sum of FOB and FU is significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wingtip/sharklet, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive, N1 is low (leak from engine), or
- Fuel is smelt in the cabin, or
- The destination EFOB turns to amber on the F-PLN (or on the FUEL PRED) page, or
- "DEST EFOB BELOW MIN" appears on the MCDU scratchpad.

If visibility permits, leak source may be identified by a visual check from the cabin.

WHEN A LEAK IS CONFIRMED

LAND ASAP

■ **Leak from engine/pylon confirmed by excessive fuel flow, low N1, or visual check:**

THR LEVER (affected engine)..IDLE
ENG MASTER (affected engine)..OFF
FUEL X FEED..AS RQRD

If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings.

DO NOT RESTART AFFECTED ENGINE

■ **Leak from engine/pylon not confirmed or leak not located:**

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing, or from the Center tank, or the APU feeding line.

FUEL X FEED..MAINTAIN CLOSED

The crossfeed valve must remain closed to prevent the leak from affecting both sides.

CTR TK PUMP 1..OFF
CTR TK PUMP 2..OFF

Each engine is fed via its associated inner tank only.

INNER TANK FUEL QUANTITIES..MONITOR

Monitor the depletion rate of each inner tank.

Continued on the following page

[QRH] FUEL LEAK (Cont'd)

- ■ **If one inner tank depletes faster than other by at least 300 kg (660 lb) in less than 30 min:**

  An engine leak may still be suspected. Therefore:

  THR LEVER (engine on leaking side)........IDLE
  ENG MASTER (engine on leaking side)........OFF
  CTR TK PUMP 1........ON
  CTR TK PUMP 2........ON
  FUEL LEAK........MONITOR

  - ■ **If leak stops:**

    ENGINE LEAK CONFIRMED

    FUEL X FEED........AS RQRD

    DO NOT RESTART AFFECTED ENGINE

  - ■ **If leak continues (after engine shutdown):**

    WING LEAK SUSPECTED

    ENGINE RESTART........CONSIDER

CAUTION	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.

- ■ **If both inner tanks deplete at a similar rate:**

  LEAK FROM CENTER TANK OR APU FEEDING LINE SUSPECTED

  - ● **If fuel smell in cabin:**
    APU........OFF

    This prevents additional fuel loss through the APU feeding line.

  - ● **When fuel quantity in one inner tank less than 3 000 kg (6 600 lb):**
    CTR TK PUMP 1........ON
    CTR TK PUMP 2........ON

- ● **For landing:** DO NOT USE REVERSERS

[QRH] FUEL LEAK

Ident.: PRO-ABN-FUEL-00018665.0006001 / 28 MAY 20

4 **Applicable to: MSN 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

A fuel leak may be detected, if:

- The sum of FOB and FU is significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wingtip/sharklet, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- A tank is overflowing (due to pipe rupture in a tank), or
- The Fuel flow is excessive, N1 is low (leak from engine), or
- Fuel is smelt in the cabin, or
- The destination EFOB turns to amber on the F-PLN (or on the FUEL PRED) page, or
- “DEST EFOB BELOW MIN” appears on the MCDU scratchpad.

If visibility permits, leak source may be identified by a visual check from the cabin.

L2 Automatic sequencing is not working.

This warning is triggered when:
a. The center tank quantity is less than 3 000 kg and there is still fuel in one or more ACTs, or
b. Any ACT is not full and there is still fuel in the previous ACT.

Thus, if a transfer failure occurs, the warning may not be displayed immediately. It will be displayed only when one of the above conditions is present.

FUEL L (R) OUTER (INNER) TK HI TEMP (Cont'd)

Ident.: PRO-ABN-FUEL-BL-00011214.0002001 / 26 NOV 19

This caution may spuriously trigger due to interference from communication equipment. Therefore, the flight crew should wait 2 min while the fuel temperature measurement is updated. After 2 min, if the ECAM caution has not disappeared, the flight crew must apply the following procedure:

GEN (AFFECTED SIDE)....................OFF

- **On the ground:**
  - DELAY T.O.
  - ENG MASTER (AFFECTED SIDE)....................OFF
- **In flight:**
  - ENG F. FLOW (AFFECTED SIDE)....................INCREASE

L2 *Disconnect autothrust. Adjust the thrust lever to increase fuel flow through the IDG oil heat exchanger and decrease the temperature of the fuel returning to the outer cell.*

L1
- **IF TEMP ABV 65 DEG C in outer cell or 57 DEG C in inner cell:**
  - APU....................AS RQRD

L2 *APU if available may be started and APU GEN used to allow IDG disconnection.*

L1
  - **If opposite GEN avail:**
    - IDG (AFFECTED SIDE)....................OFF

[QRH] LANDING WITH ABNORMAL L/G

Applicable to: MSN 01143-01246, 01376-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: PRO-ABN-LG-AD-00018650.0002001 / 17 MAR 17

1

The procedure is intended for use when the nose or main landing gear fail to extend and/or lock down following the application of the L/G GRVTY EXTN procedure.
It is preferable to use any available landing gear, rather than carry out a belly landing.
Under these circumstances, a hard surface runway landing is recommended.
Full advantage should be taken of any foam, spread on the runway.

CAUTION	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible GPWS "TOO LOW GEAR" aural alert.

Ident.: PRO-ABN-LG-AD-00018651.0002001 / 17 MAR 17

CABIN CREW....................NOTIFY

Notify the cabin crew of the nature of the emergency encountered and state intentions. Specify the amount of available preparation time.

ATC....................NOTIFY

Notify ATC of the nature of the emergency and state intentions.

GALY & CAB....................OFF

CONSIDER FUEL REDUCTION. This reduces VREF and, consequently, the load factor at impact and the energy to be dissipated.

- **If NOSE L/G abnormal:**

  SHIFT CG AFT IF POSSIBLE

  - *10 pax from front to rear moves the CG roughly 4 % aft*
  - *10 pax from mid to rear moves the CG roughly 2.5 aft.*

- **If one MAIN L/G abnormal:**

  FUEL DISTRIBUTION....................CONSIDER

  Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.

OXYGEN CREW SUPPLY....................OFF
SIGNS....................ON
CABIN and COCKPIT (LOOSE EQPT)....................SECURE

Continued on the following page

[QRH] LANDING WITH ABNORMAL L/G (Cont'd)

Ident.: PRO-ABN-LG-AD-00018652.0001001 / 17 MAR 17

- **For approach:**

  GPWS SYS........OFF
  L/G lever........CHECK DOWN
  GRVTY GEAR EXTN handcrank........TURN BACK TO NORMAL

  Rotating three turns back to normal may, in certain cases, pressurize the landing gear down actuators, thereby reducing the probability of gear collapse after touchdown.

  DO NOT ARM AUTOBRAKE

  Manual braking will enable better pitch and roll control. Moreover, with at least one main landing gear in the abnormal position the autobrake cannot be activated (ground spoilers not armed).

  EMER EXIT LT........ON
  CABIN REPORT........OBTAIN
  A/SKID & N/W STRG........OFF

  With one main landing gear not extended, the reference speed used by the anti-skid to detect a wheel blockage is not correctly initialized. As a result, the anti-skid must be switched off to prevent permanent brake release.

  MAX BRAKE PR : 1 000 PSI

  Modulate the brake pressure to 1 000 PSI because the anti-skid is off.

  - **If one or both MAIN L/G abnormal:** DO NOT ARM GROUND SPOILERS

    To keep as much roll authority as possible for maintaining the wings level.
    Ground spoiler extension would prevent spoilers from acting as roll surfaces.

  RAM AIR........ON

  To ensure full depressurization of the aircraft before impact.

  DOME LT........DIM

  Set the dome light to DIM to ensure that there is a light source after both engines are shut down after landing, in order to see and read the BRAKE PRESS indicator.

- **At 500 ft AGL:**

  BRACE FOR IMPACT........ORDER

Continued on the following page

[QRH] LANDING WITH ABNORMAL L/G (Cont'd)

Ident.: PRO-ABN-LG-AD-00018654.0001001 / 17 MAR 17

- **At flare, touchdown and rollout:**

  Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.

  Engine pumps continue to supply adequate hydraulic pressure for 30 s after engine shutdown.

  DO NOT USE REVERSE

  - **If NOSE L/G abnormal:**

    KEEP NOSE UP

    After touchdown, keep the nose off the runway by the use of the elevator. Then, lower the nose on to the runway before elevator control is lost.

    BRAKES.. SMOOTHLY APPLY

    Adapt braking to the efficiency of the elevator.

    BEFORE NOSE IMPACT : ALL ENG MASTERS OFF

  - **If one MAIN L/G abnormal:**

    AT TOUCHDOWN : ALL ENG MASTERS OFF

    KEEP AFFECTED SIDE WING UP

    Use roll control, as necessary, to maintain the unsupported wing up as long as possible.

  - **If both MAIN L/G abnormal:**

    DURING FLARE : ALL ENG MASTERS OFF

    MIN PITCH ATT : 6 °

BOTH MAIN L/G ABNORMAL

[QRH] LANDING WITH ABNORMAL L/G

Applicable to: MSN 01251

Ident.: PRO-ABN-LG-AD-00018650.0001001 / 17 MAR 17

The procedure is intended for use when the nose or main landing gear fail to extend and/or lock down following the application of the L/G GRVTY EXTN procedure.
It is preferable to use any available landing gear, rather than carry out a belly landing.
Under these circumstances, a hard surface runway landing is recommended.
Full advantage should be taken of any foam, spread on the runway.

CAUTION	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

Ident.: PRO-ABN-LG-AD-00018651.0002001 / 17 MAR 17

CABIN CREW..NOTIFY

Notify the cabin crew of the nature of the emergency encountered and state intentions. Specify the amount of available preparation time.

ATC...NOTIFY

Notify ATC of the nature of the emergency and state intentions.

GALY & CAB..OFF

CONSIDER FUEL REDUCTION. This reduces VREF and, consequently, the load factor at impact and the energy to be dissipated.

- **If NOSE L/G abnormal:**

  SHIFT CG AFT IF POSSIBLE

  - *10 pax from front to rear moves the CG roughly 4 % aft*
  - *10 pax from mid to rear moves the CG roughly 2.5 aft.*

- **If one MAIN L/G abnormal:**

  FUEL DISTRIBUTION...CONSIDER

  Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.

OXYGEN CREW SUPPLY..OFF
SIGNS...ON
CABIN and COCKPIT (LOOSE EQPT)..SECURE

Continued on the following page

[QRH] LANDING WITH ABNORMAL L/G (Cont'd)

Ident.: PRO-ABN-LG-AD-00018652.0001001 / 17 MAR 17

- **For approach:**

  GPWS SYS....................OFF
  L/G lever....................CHECK DOWN
  GRVTY GEAR EXTN handcrank....................TURN BACK TO NORMAL

  Rotating three turns back to normal may, in certain cases, pressurize the landing gear down actuators, thereby reducing the probability of gear collapse after touchdown.

  DO NOT ARM AUTOBRAKE

  Manual braking will enable better pitch and roll control. Moreover, with at least one main landing gear in the abnormal position the autobrake cannot be activated (ground spoilers not armed).

  EMER EXIT LT....................ON
  CABIN REPORT....................OBTAIN
  A/SKID & N/W STRG....................OFF

  With one main landing gear not extended, the reference speed used by the anti-skid to detect a wheel blockage is not correctly initialized. As a result, the anti-skid must be switched off to prevent permanent brake release.

  MAX BRAKE PR : 1 000 PSI

  Modulate the brake pressure to 1 000 PSI because the anti-skid is off.

  - **If one or both MAIN L/G abnormal:** DO NOT ARM GROUND SPOILERS

    To keep as much roll authority as possible for maintaining the wings level.
    Ground spoiler extension would prevent spoilers from acting as roll surfaces.

  RAM AIR....................ON

  To ensure full depressurization of the aircraft before impact.

  DOME LT....................DIM

  Set the dome light to DIM to ensure that there is a light source after both engines are shut down after landing, in order to see and read the BRAKE PRESS indicator.

- **At 500 ft AGL:**

  BRACE FOR IMPACT....................ORDER

Continued on the following page

CAUTION	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible GPWS "TOO LOW GEAR" aural alert.

■ **If L/G GEAR NOT DOWNLOCKED alert was displayed and IF TIME PERMITS:**

The landing gear recycling can be attempted up to 4 times, if necessary. These additional attempts should enable the successful pressurized extension of the landing gear and avoid a landing gear extension by gravity.

L/G lever .... UP
WAIT L/G UPLOCKED
L/G lever .... DOWN
WAIT AT LEAST 60 s

- **If unsuccessful:**

  REPEAT UP TO THREE TIMES

  - **If unsuccessful after 4 attempts:**

    WAIT AT LEAST 120 s
    L/G GRVTY PROC...APPLY

    See "In all other cases" condition below.

■ **In all other cases:**

GRAVITY GEAR EXTN handcrank.................................PULL AND TURN

Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.

L/G lever .... DOWN

The landing gear lever should be confirmed in the DOWN position for the following reasons:
- *To extinguish the UNLK lights on the LDG GEAR indicator panel*
- *To avoid the L/G CTL message on the WHEEL SD page*
- *To minimize the risk of landing gear retraction on the ground, due to an unknown system fault, when the free-fall system is reset.*

GEAR DOWN indications (if available)..................................CHECK

The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT alert may be spuriously triggered after a gravity extension.

Continued on the following page

[QRH] L/G GRAVITY EXTENSION (Cont'd)

Note: 1. *Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.*
2. *In the event of gravity extension caused by the failure of both LGCIUs, indications of the landing gears position on the ECAM are lost. LDG GEAR lights on the LDG GEAR indicator panel remain available, if LGCIU 1 is electrically supplied.*
3. *If the three green downlock arrows are not illuminated, it may indicate that the handcrank did not reach the mechanical stop. Check that the handcrank is firmly against the mechanical stop.*

N/W STEERING NOT AVAILABLE

- **If successful:**

  DO NOT RESET LDG GEAR GRVTY EXTN

  Do not reset the free-fall system. This will avoid undesirable effects such as further loss of fluid, in the event of a leak, or possible landing gear unlock, in the event of a gear selector valve jammed in the UP position.

  Note: *The free-fall system may be reset in flights used for training purpose. If the green hydraulic system is available, reset of the free-fall system enables the landing gear doors closure and the nosewheel steering operation.*
  The flight crew should not reset the free-fall system on the ground after the flight.

- **If unsuccessful:**

  LDG WITH ABNORMAL L/G PROC.. APPLY

  Refer to PRO-ABN-LG [QRH] Landing with Abnormal L/G.

(1) *This message is triggered when the failure (or combination of failures) affects the nominal aerodynamic characteristics of the aircraft.*

(2) *Disregard FMS fuel predictions and Refer to QRH/OPS Fuel Penalty Factors/ECAM Alert Table in order to find the applicable Fuel Penalty Factor.*

L/G GEAR NOT DOWN

Applicable to: MSN 01143-01246, 01376-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: PRO-ABN-LG-AA-00017859.0001001 / 21 MAR 16

ANNUNCIATIONS

Triggering Conditions:

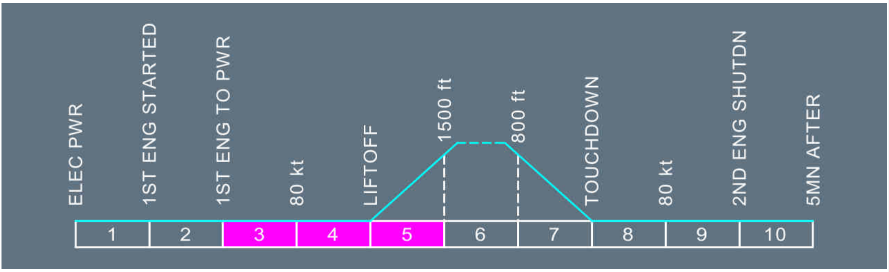
L2

This alert triggers when:

1. L/G is not downlocked and radio height is lower than 750 ft and both engines N1 lower than 75% (or if engine shutdown N1 of remaining engine lower than 97%) or
2. L/G is not downlocked and radio height is lower than 750 ft and both engines are not at T.O power and flaps at 1, 2, 3 or FULL or
3. L/G is not downlocked and flaps at 3 or FULL and both radio altimeters are failed.

Note: In the cases 2 and 3 above, the aural warning can only be cancelled by the emergency cancel pushbutton.

Flight Phase Inhibition:



Ident.: PRO-ABN-LG-AA-00018573.0002001 / 21 MAR 16

6

L2 When this warning appears, the red arrow on the instrument panel comes on.

L1 Crew awareness.

L/G GEAR NOT DOWN (Cont'd)

Ident.: PRO-ABN-LG-AA-00018573.0001001 / 21 MAR 16

L2 When this warning appears, the red arrow on the instrument panel comes on.
This warning could be wrongly triggered in the case of landing gear position sensors disagreement between LGCIU 1 and LGCIU 2. In this case, check that at least one green triangle is displayed on each landing gear strut on the WHEEL SD page. This confirms that the landing gear is downlocked. Rely also on the "**LDG GEAR DN**" green MEMO message to confirm that the landing gear is downlocked. Press the EMER CANC pb on the ECAM Control Panel (ECP) to stop the Continus Repetitive Chime (CRC) and press the CLR pb on the ECP to clear the warning on the ECAM display.

L1 Crew awareness.

[MEM] EMER DESCENT

Ident.: PRO-ABN-MISC-00012092.0001001 / 17 MAR 17
Applicable to: ALL

CREW OXY MASKS..USE
SIGNS..ON
EMER DESCENT..INITIATE

- **If A/THR not active:**

  THR LEVERS..IDLE

SPD BRK..FULL

- **When descent established:**

  SPEED..MAX/APPROPRIATE

  - **If structural damage suspected:** MANEUVER WITH CARE

  CONSIDER L/G EXTENSION
  ENG MODE SEL..IGN
  ATC..NOTIFY

  Notify ATC of the nature of the emergency, and state intention. The flight crew can communicate with the ATC using voice, or CPDLC when the voice contact cannot be established or has poor quality.

  EMER DESCENT (PA)..ANNOUNCE

  The flight crew must inform the cabin of emergency descent on the PA system.

  ATC XPDR 7700..CONSIDER

  Squawk 7700 unless otherwise specified by ATC.

  CREW OXY MASKS DILUTION..NORM

  - *To save oxygen, set the oxygen diluter selector to the N position*
  - *If the oxygen diluter selector remains set to 100 %, oxygen quantity may be insufficient to cover the entire emergency descent profile*
  - *Ensure that crew communication is established with oxygen masks. Avoid the continuous use of the interphone to minimize interference with the breathing noise in the oxygen mask.*

  MAX FL: 100/MEA-MORA

  - **If CAB ALT above 14 000 ft:**

    OXYGEN PAX MASK MAN ON..PRESS

    This action confirms that the passenger oxygen masks are released.

COCKPIT PROCEDURES

BACKGROUND

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.
To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.
These conditions are achieved by using the manual pressure control.

PROCEDURE

The following procedure assumes that it is initiated during climb or cruise:

First, maintain the cabin altitude using manual pressure mode.
While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI.
During further steps of descent, maintain delta P at 1 PSI using the cabin V/S target selector.
During the approach, use automatic pressure mode in order to reduce the differential pressure to zero at touchdown.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

CKPT/CAB COM...ESTABLISH

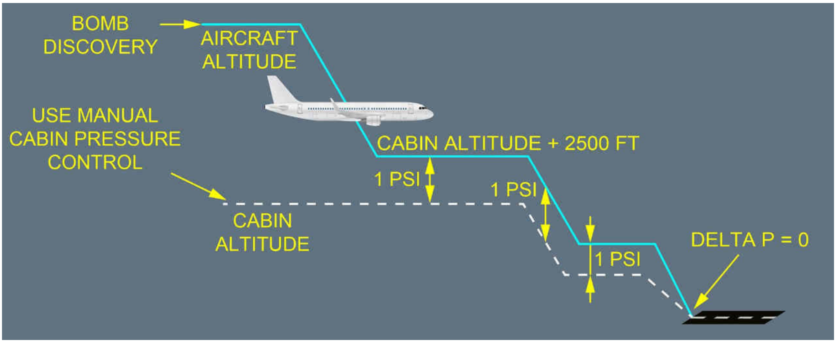
■ **If landing and evacuation possible within 30 min:**

ATC/COMPANY...NOTIFY
EVAC...PREPARE

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

- **If landing and evacuation NOT possible within 30 min:**



AIRCRAFT (IF CLIMBING)..LEVEL OFF

CABIN PRESS MODE SEL..MAN

L2 *The purpose is to immediately prevent the cabin altitude from increasing, in order to avoid the activation of an altitude-sensitive bomb.*

L1 MAINTAIN CAB ALT

L2 *Use MAN V/S CTL sw to maintain the cabin altitude at the value it had when the bomb was discovered.*

L1 ATC/COMPANY..NOTIFY

L2 *To obtain expert advice from explosive specialists.*

L1 TRGT SPEED: PREFER LO IAS

Low speed could reduce the consequences of possible structural damage, if the bomb explodes.

DESCENT TO CAB ALT + 2 500 ft or MEA - MORA...INITIATE

L2 *Descending to 2 500 ft above the cabin altitude gives a cabin differential pressure of approximately 1 PSI, which helps to ensure that the blast goes outwards, if the bomb explodes.*

L1 AVOID SHARP MANEUVERS

L2 *Which might result in the bomb moving.*

L1 MAINTAIN CAB ALT

L2 *Use MAN V/S CTL sw to maintain the cabin altitude. Initially brief UP input should be required; but, be careful not to increase the cabin altitude.*

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

L1

- **When at CAB ALT + 2 500 ft:**

  MAINTAIN 1 PSI ∆P

  L2 *Use MAN V/S CTL sw to adjust delta P to 1 PSI. Brief DN input should be initially required to set 0 ft/min cabin vertical speed.*

  L1 GALY & CAB....................OFF
  FUEL RESERVES....................DETERMINE

  When flying at cabin altitude + 2 500 ft, fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.

  - **When bomb secured at the LRBL or cannot be moved:**

    Least Risk Bomb Location (LRBL) is the center of the RH aft cabin door

    EMER EXIT LT....................ON

    L2 *To recover minimum cabin lighting when the COMMERCIAL pb is OFF*

    L1 COMMERCIAL....................OFF

  - **If fuel permits:**

    FLAPS....................AT LEAST CONF 1
    L/G lever (except for flight over water)....................DOWN

    L2 *The detonation could damage the landing systems. Therefore, if fuel permits, configure the aircraft for landing as soon as possible. Reducing the speed will minimize stress on the aircraft structure.*

    L1 USE NORMAL CONF FOR LANDING

  DURING FURTHER DESCENT: MAINTAIN MAX 1 PSI ∆P

  Use MAN V/S CTL sw to DN to adjust delta P to 1 PSI.

  - **During approach:**

    CABIN PRESS MODE SEL....................AUTO

    L2 *This allows CPC to automatically control the cabin altitude to 0 during final approach.*

L1

- **When aircraft on ground and stopped in a remote area (if possible):**

  Refer to PRO-ABN-MISC [QRH] EMER EVAC.

CABIN PROCEDURES

If a suspect device is found in the cabin:

WARNING	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

	result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
WARNING	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
CAUTION	The least risk bomb location for the aircraft structure and systems is center of the RH aft cabin door.

EOD PERSONNEL ON BOARD....................CHECK

L2 *Announce "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

L1 DO NOT OPEN THE BOMB
DO NOT CUT BOMB'S WIRES
SECURE BOMB AGAINST SLIPPING
PROTECT BOMB AGAINST SHOCKS

L2 *Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

L1 PASSENGERS....................LEAD AWAY FROM BOMB

L2 *Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*
Passengers near the bomb should protect their heads with pillows, blankets.
All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables should be in their full upright position.
Service items may need to be collected in order to secure tray tables.

L1 PORTABLE ELECTRONIC DEVICES....................SWITCH OFF

L2 *The cabin crews must command passengers to switch off all portable electronic devices.*

L1 BOMB....................CHECK NO ANTI-LIFT DEVICE

L2 *To check for an anti-lift switch or lever, slide a string or stiff card, (such as the emergency information card) under the bomb, without disturbing the bomb.*
If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.
If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.
If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e. g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

L1 EMERGENCY EQUIPMENT....................REMOVE AND STOW

L2 *Emergency equipment (PBE, fire extinguisher, etc.) located close to the LRBL must be removed and stowed in alternate location.*

L1 GALLEY/IFE POWER....................OFF

L2 *All galley and IFE equipment located close to the LRBL must be switched off.*

L1 ● **If the bomb can be moved:**

RH AFT CABIN DOOR SLIDE.................... DISARM

LEAST RISK BOMB LOCATION (LRBL).................... PREPARE

L2 *Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*
On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.
Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.

CAUTION	*DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.*

L1 BOMB INDICATION LINE....................POSITION

Note: *A bomb location indicator line is a 6 to 8 ft (1.8 to 2.4 m) (e.g. neckties, headset cord, or belts connected together) preferably of constrating color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.

BOMB....................MOVE TO LRBL

L2 *Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

CAUTION	*Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.*

L1 LEAST RISK BOMB LOCATION (LRBL)....................COMPLETE

L2 *Place an additional single thin sheet of plastic over the bomb.*

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

CAUTION	*DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.*

L1

Build up at 25 cm (10 in) of wetted material around the sides and on top of the bomb.

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

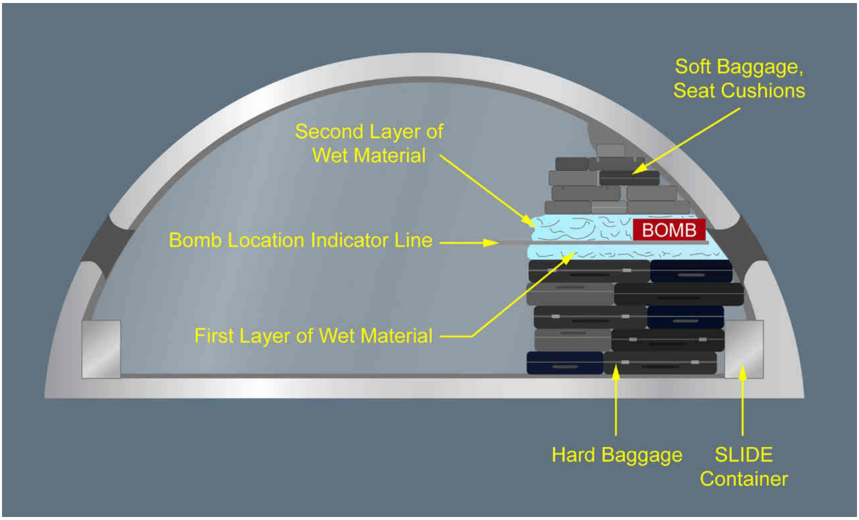
L2

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.
Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water or any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

L1

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

LRBL STACK



Soft Baggage,
Seat Cushions
Second Layer of
Wet Material
BOMB
Bomb Location Indicator Line
First Layer of Wet Material
Hard Baggage
SLIDE
Container
